

Engraved for the Youth's Faithful Monitor &c.

1481 d. 4  
Youth's faithful Monitor:

OR, THE  
*Young Man's Best Companion.*

C O N T A I N I N G

A compendious ENGLISH GRAMMAR, proper for all Youth to be acquainted with.

READING and WRITING made easy, with Copies of the same; Letters on various Subjects, Receipts and promissory Notes, Forms of Bills of Debt, Bills of Sale, Bonds, Indentures, Wills, &c.

Also, ARITHMETIC laid down in an easier Manner than any yet extant; whereby a Person of a mean Capacity may attain the same without the Help of a Master.

MERCHANTS ACCOMPTS, or, the best Method of Book-KEEPING, after an easy and short Method, the Forms of Bills of Exchange, the Fares of Watermen as set forth by the Lord Mayor and Aldermen.

L I K E W I S E

MENSURATION, GAUGING, and SURVEYING made easy; with some very useful Tables of Interest, calculated on a new Plan.

of Miles from London, and Market Days in England and Wales, and a correct List of all the Fairs.

ASTRONOMY and GEOGRAPHY; containing a Description of the Use of the Globes celestial and terrestrial; with a Description of the Product, Counties, Market Towns with their Distance

Likewise the Art of DIALLING; how to erect and fix them; with Instructions for making Colours; together with a choice Collection of curious RECEIPTS.

*To which is added*

A curious Abstract of the HISTORY of ENGLAND, with all the remarkable Events down to the present Year.

*With a great Variety of COPPER-PLATES and CUTS.*

By WILLIAM WOOLGAR, Accomptant.

The T H I R D E D I T I O N .

Improved, enlarged and corrected

By JOHN WRIGHT, Gent.

Author of the American Negotiator.

L O N D O N :

Printed for D. STEEL, King Street, Little Tower Hill; H. SERJEANT, Temple Bar; Messrs. WILSON and FELL, and J. JOHNSON and Co. in Paternoster Row; 1766.

## P R E F A C E.

*A*S it may in all Probability be deemed a Presumption in me to publish YOUTH'S FAITHFUL MONITOR: or, The YOUNG MAN'S BEST COMPANION, when there are already so many of that Kind upon such useful Subjects; give me Leave in this short Preface to apologize for what induced me to the Publication.

Knowledge is at all Times not only deemed necessary to Youth (several of whom are intrusted to my Care) but acceptable to those of riper Years. As Conciseness is the best Method of teaching, and there being always Room for Improvement, was my chief and principal Motive.

I have gone upon a different Plan from any of the same Nature, by treating upon Subjects that others have omitted; and rendered the whole intelligible not only to the meanest Capacity, but useful and edifying to adult Persons.

1<sup>st</sup>. I have begun with a compleat English Grammar, by which Youth may learn the Propriety of the English Tongue without the Help of a Master. I have fully treated upon Writing, Reading and Arithmetic in all its Branches; and proceeded by Degrees to Surveying, Mensuration and Gauging. I have likewise largely expatiated upon the Art of Book-keeping (that others have only hinted at) which is necessary to be known by those who are bred to the Accompting-house, giving them the Forms of Bills of Lading, Invoices, Entries, Bills of Parcels and Receipts, Nature of Business transacted at the Water-side, with the Rates of Watermen as set forth by the Lord Mayor and Court of Aldermen; several Tables of Interest, calculated on a new Plan, peculiarly adapted for India Bonds and the public Funds, &c. which upon slight Calculation answer the Purpose of the best Tables of Interest contained in entire Volumes on that Subject alone.

2<sup>dly</sup>, I have added an entertaining System of Astronomy and Geography, shewing the Nature and Use of the Globes, celestial and terrestrial; and not only under the Head of Geography, given the principal Towns in England and Wales, but also their Distances from London, with their Market Days, and several Fairs therein held, that the Reader cannot miss of finding them.

3<sup>dly</sup>,

3dly, I have entertained the Reader with a general Survey of Dialling, with the Form of each seperate Dial, drawn to an exact Truth, and according to the regular Plan of Mensuration.

4thly, There are several curious Receipts, not contained in any other Collection whatsoever, that may be effectually and safely depended on.

Lastly, I have concluded the whole with a complete and impartial Abstract of the History of England, from the Coming in of the Romans, with all remarkable Events down to the present Year, without omitting any material or curious Occurrences that have happened. The whole of which is so adapted to the Capacity of Youth, as will render him not only capable of discoursing upon the most material Parts of History, but refresh his Memory by way of Chronology.

As for such as are perfect Masters of the Sciences contained herein, this little Piece may appear insignificant; but I am sensible that there are many in the World to whom it will prove of infinite Service; and as I pretend not to recommend the Work by comparing it with other Authors, so am I persuaded it will not be totally condemned, especially when it is considered that I have engaged an able Assistant in this present Edition.

P R E F A C E.

*I have no more at present to add, but to return my sincere Thanks to the Public, who have encouraged my former Editions, and must still beg of every candid and judicious Reader, that if he should by Chance find an Error in a Letter or Figure, to excuse it, for notwithstanding all my Care, Errors of the Press are but too often subject to escape the nicest Eye.*

Feb. 27, 1766.

1766 1766

William Woolgar.

YOUTH's FAITHFUL MONITOR:

OR, THE

YOUNG MAN's

BEST

COMPANION.

*Of Learning in General; and the Use of Letters.*

Good, true and well grounded education in youth, seldom fails of making them good men; and as learning is the chief foundation, great care should be taken to instruct them in such a manner as to render them in time useful members to community.

All possible methods should be taken to make learning in general advantageous to the meanest capacities; and tho' the design of this book is chiefly calculated to form the minds of youth, the author has been remarkably careful to compile what will be equally useful and instructive to those of riper years.

Since then education in general is so necessary to make the man, how careful should the youth be to make learning his chief study, and by close application, endeavour to gain the knowledge of reading and writing with the greatest propriety. Having said thus much of education in general, I proceed first to give a short account of the several parts of the English tongue, taken in a grammatical sense: By which it will appear to be extremely simple in its com-  
positions

positions, and free from the many rules which render others so difficult to the learner: For tho' Grammar is the same in all languages, (except the Chinese;) yet every Grammar ought to be adapted to the genius of that language, which it is intended to illustrate and explain. But before I proceed to grammar, give me leave, for the better instruction of my youthful reader, to begin with the letters, the number of which are 26, to wit, *a b c d e f g h i j k l m n o p q r s t u v w x y z*. The *i* and *u* used to be wrote *j* and *v*, and distinguished by *i* and *u* consonants, but at present are more properly called *ja* and *vee*; observe well the different forms of them, whether great or small, by which means you must distinguish them in pronunciation.

Letters are distinguished, according to their sound, into vowels and consonants: A vowel is a letter that sounds by itself, and are six in number, viz. *a, e, i, o, u*, and *y* the Greek vowel, which also is an English vowel, when it comes after a consonant, has the sound of *i*, as in *by, fly, reply, syllable*, &c. but is never used, in the middle of a word but always at the end, except the word is derived from foreign language. A consonant is a letter that sounds not, except it is joined to a vowel, for without some of the vowels no syllable can be made; as *b, c, d*, &c. without the aid of a vowel, cannot be sounded. Though we have 26 letters, and 6 of them vowels, yet we have 21 consonants; for *y*, when *f* or *t* before any vowel in the same syllable, becomes a consonant; as in *youth, yonder, beyond*, &c. Note, That *j* hath the sound of *g*, as in *join, jangle, jingle*, &c.

When two vowels come together in a syllable, and are not parted in the pronunciation, but united in one sound, they are called diphthongs; of these there are 13, viz. *ai, ei, oi, ui, au, eu, ou, ee, eo, ea, eu, oa*, and *ie*; as in *maid, faith, either, join, aul, eunuch, stout, feed, seed, food, breed, speak, wealth, people, steeple, boat, goat, beat, bear, seat, friend, field*, &c. Note, That in the first 7 words, both vowels are sounded; but in the other 15 one of them is scarcely heard.

Triphthongs are those, where three vowels meet in one sound; as in *beauty, beau, lieu*, and *quaint*: Likewise *ay, ey, oy, uy*; *aw, ew*, and *ow* become diphthongs at the end of words, but are called improper diphthongs; as in *joy, boy, joy, saw, bow*, &c. Note, *aw ew* and *ow* are commonly sounded as *au, eu* and *ou*.

## The Young Man's best Companion. 3

These letters following keep their natural sound, viz. *b*, *c*, *e*, *f*, *g*, *i*, *l*, *o*, *s*, *t*, *u*, *x*, *y*; and the double letters *ch*, *gh*, and *ph*. viz.

*B* is sounded like *t* in *subtil*.

*C* before *a*, *o*, *u*, *l* and *r*, is always sounded like *k*; as in *cat*, *cord*, *cup*, *cloth*, *cramp*: but before *e*, *i* and *y*, is always sounded like *s*; as in *cellar*, *civil*, *cypress*: it is also sounded like *s* in *muscle*; and in words derived from the French, having *b* after it; as in *machine*.

*E* is sounded like *a* long, in *there*, *where*, &c.

*F* is sounded like *v* in *of*.

*G* before *e* and *i* in some words, and almost always before *y*, is sounded like *j*; as in *gentleman*, *giant*, *Egyptian*.

*I* in words derived from the French, sounds like *ee*; as in *machine*: it also sounds like *u* short; in *bird*, *third*, &c.

*L* is sounded like *m* in *salmon*.

*O* is sounded like *a* long in *alloy*; like *e* short in *women*; and like *u* short in *worm*.

*S* is frequently sounded like *z*; as in *present* *presume*.

*T* is sounded like *s*, in *whistle*, *thistle*; *ti* before a vowel, is sounded like *fi* or *sh*, as in *nation*; except when *s* goes immediately before it; as *celestial*; or at the beginning of a word; as *ried*; or in derivatives; as *mightier*, *mightiest*, *emptied*.

*U* is sounded like *e* short in *bury*, and like *i* in *business*.

*X* hath no sound of its own; but at the beginning of a word is always sounded like *z*; as in *Xenophon*; and in the middle and end of words like *k*; as in *quax*, *Xerxes*.

*Y* at the end of monosyllables, is sounded like *i* long; as in *by*, *my*; but in the middle of words of more than one syllable, it is sounded like *i* short; as in *Egypt*; and at the end of words of more than one syllable, it usually sounds like *e*; as in *many*.

*Ch* is sounded like *qu*, as in *choir*, *cherisher*.

*Gh* sometimes at the end of a word, and always *ph* when they come together in the same syllable, sound like *j*; as in *laugh*, *elephant*; except where *ph* sound like *w*, as in *Stephen*.

*Of LETTERS great and small, and when to be used.*

**G**REAT Letters should never be used in the middle of a word, or yet at the latter end, except the word be wholly in capitals, as *JERUSALEM, GOD, CHRIST, &c.* for it would look very ridiculous to see great letters in the middle or end of words, as *jeRusAlem, &c.* instead of *Jerusalem.* But all capitals should be written at the beginning of sentences; as, *The good man feareth God, &c.* also at the beginning of interlocutions: Likewise after every full stop: At the beginning of all proper names of places, ships, rivers, and at the christian and sir-names of men and women. The personal pronoun *I*, and the interjection *O* (are to be remarked) should always be a capital, let them fall either at the beginning or middle of sentences. Observe likewise the small *s* is commonly written *s* at the beginning and middle of a word, and *z* at the end; but if two happen together in the middle or at the end of a word they are to be written thus, *ss*.

The custom used formerly to prevail, of placing initial letters to all manner of substantives, but as it is of no very great signification, authors of late date have left it off. — Thus much for letters; give me leave to proceed next to grammar.

## GRAMMAR.

**G**RAMMAR is the art of speaking with the true propriety, and is divided into four parts, *viz.*

1. ORTHOEPEY, or the art of pronouncing words with propriety and good grace.
2. ORTHOGRAPHY, or the art of spelling with truth, and writing our words with proper letters.
3. ETYMOLOGY, how to distinguish words by various significations, kinds and properties. And
4. SYNTAX, which teaches how to join words in a sentence, or sentences together.

## *Of SYLLABLES.*

**A** SYLLABLE is the pronunciation of one letter or more in one breath; as *strength, &c.* and can consist of no more letters than eight, yet there are but very few that admit of so many.

Of the DIVISION of SYLLABLES.

Division of syllables may be comprehended in several general rules.

1. A single consonant between two vowels, or between a vowel and a diphthong, must be joined to the latter syllable, as, *ba-bit*.

Except the letters *p, w, x*, which go to the former syllable, as, *up-on, pow-er, ex-ist*.

Except likewise words compounded, which must be divided according to their original.

2. When two consonants come in the middle of a word, that cannot begin a word, they must be divided, as, *lum-ber*.

Except when they come in the middle of a derivative, though not proper to begin a word, they must not be divided, as, *stand-ard*.

3d. When two consonants come between two vowels, and are such as cannot begin a word, they must be divided as *ut-most, un-der, in-fer*, &c. but in case they can begin a word, they both go to the latter vowel, as, *fa-ble, sti-ple*.

4th. When three consonants meet in the middle of a word, if they begin a word they must begin a syllable, as, *il-lu-strate*.

If they are proper to end a word, they may all be put to the former syllable, as, *thatch-er*.

If the two first be proper to end a word, the third may go to the latter syllable, as, *rank-ness*.

If the two last be proper to begin a word, they likewise begin the syllable, as, *hin-drance, pim-ple*.

5. When two vowels come together, and are no diphthongs, that is are fully sounded, they must be divided into syllables thus, as *se-ci-ety, vi-ol, vir-tu-ous*, &c.

Of WORDS.

THE use of WORDS are to convey our sense of things to another person, and for that purpose are divided into four classes, *viz.*

1. Names. 2. Qualities. 3. Affirmations. And 4. Articles.

NAMES.

Names declare things themselves, and need not the help of any other word to make them understood, as, *a bay, a ship*,

*shit*, a *cow*, &c. But these names in general admit of *a*, *an*, or *the* before them, as *a house*, *an onion*, *the world*.

Sometimes they need not either of those articles, but stand by themselves as *miser*, *joy*, *sorrow*, &c.

These names have two different numbers, *viz.* the Singular and Plural. The Singular speaketh but of one, as *a stone*; the Plural of more than one, as *stones*.

The manner of making singulars plurals, is by adding *s*, as *cap*, *caps*, *mug*, *mugs*, *cat*, *cats*, &c.

But when the singular ends in *ce*, *ch*, *se*, *sh*, *x*, *ze*, or *ge*, when sounded soft we either must add *s*, or *es*, and make another syllable, as, *grace*, *graces*; *church*, *churches*; *purse*, *purses*; *fish*, *fishes*; *fox*, *foxes*; *mace*, *maces*; *stage*, *stages*.

There are many exceptions to this rule, as *man* in the plural number makes *men*; *woman*, *women*; *child*, *children*; *knife*, *knives*; *staff*, *staves*, &c.

There are several words which have no singular number; and, on the contrary, there are some which have no plural, Proper names have no plural, because they agree but to one.

As to personal names when mentioned in conversation, they must be either spoken of ourselves to another, or of a third; and there be three persons in the singular, and three in the plural, *viz.*

Singular.	Plural.
<i>I</i> is the 1st person,	<i>We</i> the 1st person,
<i>Thou</i> , <i>thee</i> or <i>you</i> , the 2d.	<i>Ye</i> or <i>you</i> , the 2d person,
<i>He</i> , <i>she</i> or <i>it</i> , the 3d person.	<i>They</i> , the 3d Person.

These following have a leading state, as *I* has *me*; *he*, *him*; *she*, *her*; *we*, *us*; *ye* or *you*, *them*; *they*, *them*.

Note, *I*, *he*, *she*, *we*, *she* and *they*, begin a sentence but seldom end it: *me*, *him*, *her*, *us* and *them*, seldom or never begin a sentence, but often end one.

## QUALITIES.

Some qualities proceed from personal names, as *my*, *mine*, *thy*, *thine*; *our*, *ours*; *your*, *yours*; *her*, *hers*; *their*, *theirs*, &c.

These qualities serve to express the nature, or manner of things, as *good*, *bad*, *great*, *small*, *green*, *black*, &c. and by putting to it a name, or thing, will make good sense, as *a good boy*, *a bad girl*, *a great dog*, *a small room*, *a green leaf*, *a black bat*, &c.

*Note*, The articles *a*, *an*, or *the* are qualities, but have a different use and signification, *viz.* *a* or *an* expresses the same; only *a* is used before a consonant, and *an* before a vowel, as *a sword*, *a knife*; *an egg*, *an ear*. The article *the*, shews the reality of a thing itself, as, *the clock struck six*; signifies that very clock we are speaking of.

Qualities, likewise, have three degrees of comparison, as first, *tall*, second, *taller*, third, *tallest*; or suppose I am speaking of three persons, *John is tall*, *James is taller*, *Samuel is tallest*; again, *Sarah is pretty*, *Mary is prettier*, *Susan is prettiest*.

### Of AFFIRMATIONS or VERBS.

**A** VERB is a part of speech, that betokens doing, suffering, or being, as *I love*, *I am loved*, *I live*.

Verbs are known by the word *to* going before them, as *to laugh*, *to cry*, *to weep*, *to dance*, *to be cold*, *to be lame*, &c.

There are three sorts of verbs, *viz.* active, passive and neuter. A verb active, denotes an action, or doing of any thing; and in such a manner, that the person or thing it acts upon follows the verb, as *I love her*, &c. And a verb that signifies suffering, has the title of a verb passive, as *I am loved*. The English tongue has no passive verbs, for we have not a word that denotes suffering, but is supplied by the use of two or three words, which are called auxiliary or helping verbs.

A verb neuter signifies the state or being, and sometimes the action of a person or thing but has no noun after it to denote the subject of action.

A verb neuter is sometimes active, as *I run*; and sometimes passive, as *I am sick*.

There is another verb called impersonal, being without any distinction to either sex; and is governed by the word *it*, as, *it thunders*, *it snows*, *it is hot*, &c.

There are also belonging to verbs four things, numbers, persons, moods and tenses; and first of numbers, *viz.* two, the singular and plural.

### Of PERSONS.

Verbs have six persons, *viz.* three singular, and three plural, as

*I*, *thou*, or *you*, *he* or *she* or *it*, are singular:

*We*, *ye* or *you*, and *they* are plural.

Or

Or thus,

Singular.

Plural.

*I play or do play,  
Thou playest or dost play,  
He playeth or doth play.*

*We play or do play,  
Ye or you play, or do play,  
They play or do play.*

## Of MOODS.

Moods signify the various ways of expressing a verb or action of a verb; and strictly speaking, the English have no mood; because they have no alteration of the verb itself, unless in the second and third persons singular of the present tense, and the second person singular of the preterimperfect: therefore, the mood in English is expressed or known by certain words called helping verbs; of which are two sorts, perfect and defective: the former are the verbs *am, be, or have*; the latter *do, may, can, might, will, would, shall, should, could, must, or ought*; as thus, the possibility of any thing to do, or to be done, is expressed by *can* or *would*, the liberty or design of the speaker or doer, by *may* or *might*; the inclination by *will* or *would*; and the necessity of doing a thing, by *must* or *ought, shall* or *should*.

## Of TENSES.

Tense, in grammar, signifies the different times of an action, viz. first, it shews the action or thing that is doing, but not finished. Second the action or thing finished or done, without regard to any thing else. Third, the action not yet done, but will soon be done or finished, which are comprehended in the time present, time past, and time to come.

There is another division of time, viz. The time past is subdivided, 1st. into the time not perfectly past. 2d. The time long-past; and the time to come is subdivided into the time some great while to come.

## Of REGULAR VERBS.

**R**EGULAR verbs are those that observe a stated rule in the formation of their times.

A regular verb keeps the same in every person, tense, or time, save sometimes it has a syllable more in some of the persons, and a syllable more in some of the tenses, of which I shall give you a hint by way of example.

Present

Present Time.

*Singular.* I love *or* do love, thou lovest *or* dost love, *or* you love *or* do love, he loveth, loves, *or* doth *or* does love.

*Plural.* We love *or* do love, ye *or* you love, *or* do love, they love *or* do love.

Preterperfect time, *or* Time past.

*Singular.* I have loved, thou hast *or* you have loved, he has *or* hath loved.

*Plural.* We have loved, ye *or* you have loved, they have loved.

Preterimperfect Time, *or* Time not perfectly past.

*Singular.* I loved *or* did love, thou lovedst *or* didst love, *or* you loved *or* did love, he loved *or* did love.

*Plural.* We loved *or* did love, ye *or* you loved *or* did love, they loved *or* did love.

Preterpluperfect Time, *or* Time long past.

*Singular.* I had loved, thou hadst *or* you had loved, he had loved.

*Plural.* We had loved, ye *or* you had loved, they had loved.

First future Time, *or* Time to come.

*Singular.* I shall *or* will love, thou shalt *or* wilt love, *or* you shall *or* will love, he shall *or* will love.

*Plural.* We shall *or* will love, ye *or* you shall *or* will love, they shall *or* will love.

Second future Time, *or* Time of long space to come.

*Singular.* I shall *or* will love hereafter, thou shalt *or* wilt *or* you shall *or* will love hereafter, he shall *or* will love hereafter.

*Plural.* We shall *or* will love hereafter, ye *or* you shall *or* will love hereafter, they shall *or* will love hereafter.

The perfect verb *am* *or* *be*, is used to supply the want of verbs passive in the English language, and make the sentence compleat, by being joined to them, *or* going before them, as *I am grieved.*

As for Example:

Present Time.

*Singular.* I am wounded, thou art *or* you are wounded, he is wounded.

*Plural.*

10 *Youth's faithful Monitor: Or*

*Plural.* We are wounded, ye *or* you are wounded, they are wounded.

Preterperfect Time, or Time past.

*Singular.* I have been wounded, thou hast *or* you have been wounded, he hath *or* has been wounded.

*Plural.* We have been wounded, ye *or* you have been wounded, they have been wounded.

Preterimperfect Time, or Time not perfectly past.

*Singular.* I was wounded, thou wast *or* you was wounded, he was wounded.

*Plural.* We were wounded, ye *or* you were wounded, they were wounded.

Preterpluperfect Time, or Time long past.

*Singular.* I had been wounded, thou hadst *or* you had been wounded, he had been wounded.

*Plural.* We had been wounded, ye *or* you had been wounded, they had been wounded.

First future Time, *or* Time to come.

*Singular.* I shall *or* will be wounded, thou shalt *or* wilt *or* you shall *or* will be wounded, he shall *or* will be wounded.

*Plural.* We shall *or* will be wounded, ye *or* you shall *or* will be wounded, they shall *or* will be wounded.

Second future Time, or Time of long space to come.

*Singular.* I shall *or* will be wounded hereafter, thou shalt *or* wilt *or* you shall *or* will be wounded hereafter, he shall *or* will be wounded hereafter.

*Plural.* We shall *or* will be wounded hereafter, ye *or* you shall *or* will be wounded hereafter, they shall *or* will be wounded hereafter.

*Of PARTICIPLES.*

A participle is a part of speech derived of a verb, and signifies either being, doing, or suffering, as a verb does: Of which there are two, *viz.* active, having *ing* added to the verb, as *loving*; passive having *d*, *t*, or *n* added, as *loved*, *taught*, *slain*.

*Of ADVERBS.*

An adverb is a part of speech joined to a verb, to an adjective, to a participle, or to another adverb, to declare their signification, as

First

First, to a verb thus :

*Sarah loves John sincerely.*

Secondly, to an adjective thus :

*Chloe is a very comely Lass.*

Thirdly, to a Participle thus .

*He is a Man justly deserving preferment.*

Fourthly, to another adverb thus :

*He speaks very prudently.*

Adverbs ending in *ly*, are derived from adjectives, as from *just*, *true*, *brave*, &c. come *justly*, *truly*, *bravely*, &c.

Some adverbs are likewise compared, as *soon*, *sooner*, and *soonest*, &c.

## OF CONJUNCTIONS.

A Conjunction is a part of speech that joins words and sentences together, and shews the reason of a thing, or the manner of their dependance.

The following are some of the principal, viz. *and*, *as*, *alike*, *also*, *but*, *because*, *either*, *except*, *for*, *howsoever*, *if*, *likewise*, *moreover*, *no*, *not*, *namely*, *nevertheless*, *or*, *otherwise*, *save*, *since*, *that*, *therefore*, &c.

There are various kinds of conjunctions, but the chief are *copulatives*, *disjunctives*, *casuals*, and *conditionals*, as for Example :

1. A conjunction copulative, joins words or sentences together, as *I sing*, and *James dances*.

2d. A conjunction disjunctive, joins words, but makes a division in the sense of the thing, as *I or James shall be beat*.

3d. A conjunction casual, shews the cause or reason of a thing, as, *I do work that I may eat*.

4th. A conjunction conditional, renders the speech doubtful, as, *If the seas dry up, we shall find great riches*.

## OF PREPOSITIONS.

A Preposition is a part of speech most commonly set before other parts of speech, and are either 1st. In apposition or seperated, 2d. Joined or in composition.

Prepositions of apposition are these, viz. *above*, *about*, *after*, *against*, *at*, *among*, *amongst*, *before*, *beside*, *betwixt*, *between*, *below*, *behind*, *beyond*, *by*, *beneath*, *far*, *from*, *in*, *into*, *off*, *on*, *or*, *upon*, *out*, *of*, *towards*, *to*, *until*, *on this side*,

*side, on that side, over, through, under, up to, with, within, without.* As for example:

*John and Peter travelled into Egypt.*

Here *into* is the preposition, separated from the noun; but if the noun be left out, it is expressed thus, *John went before, and Peter followed after, viz. John went before Peter, and Peter followed after John.*

Prepositions of composition are these, *viz. ad, en, in, up, out, mis, dis, &c. adverb, enjoy, undone, upside, &c.*

### OF INTERJECTIONS.

**A**N interjection is a part of speech, that betokens a sudden passion of the mind, either by being surprized overmuch, or by jesting, doubting, &c. and generally have a note of admiration after them, as *oh! alas! O! wondrous! ho brave boys!*

### OF SENTENCES.

**A** Sentence is the joining two or more words together, so as to make perfect sense, as, *Julius Cesar was a worthy man, for under his conduct the Romans first entered into Britain.*

There are two kinds of sentences, simple and compound. A simple sentence is that wherein there is but one verb, and one nominative word of the subject either expressed or understood, as, *the bell rings.*

A compound sentence is two simple sentences joined together by a conjunction, or a relative, as, *I run and you fight, I laugh and you mourn, I pipe and you dance, &c.*

Moreover, for the due joining of words, there are three concords. The first is between the nominative word and the verb, *viz.* The nominative word is the thing or person that either is, does or suffers; and is, in general, set before the verb, as, *James laughs, John mourns, Judas betrays, &c.* Except when a question is asked, and then the nominative is set after a verb, as *lovest thou? doth the king come?*

Likewise if it be an imperative sentence, as, *work thou, ring the bell, &c.*

And sometimes when the words *it* or *there* come before the verb, as, *it is my book, there came one to me.*

In a conditional sentence, *Had I been covetous to please*

my master, I would have used diligence; for, if I had been covetous, &c. To find the nominative word or case to the verb, ask this question, who or what? and the word that answers to the question shall be the nominative case to the verb, as, *I read the book through*: Who read the book through? *I*, &c.

A verb personal agrees with his nominative case, in number and person, as, *the master readeth, and ye regard not*.

Many nominative cases singular, with a conjunction copulative coming between them, will have a verb plural, as, *Thomas and Charles were both at school*, &c.

Note also, That sometimes the infinite mood of a verb is the nominative case to the verb, as, *to steal is scandalous*. Sometimes a whole clause foregoing, may be the nominative case to the verb, as, *to rise betimes in the morning, is the most wholesome thing in the world*.

When a verb follows a noun of multitude, it may be put in the plural, when the case is absolutely determined to be more than one, as, *the multitude wondered when they saw the dumb to speak, the lame to walk*, &c. and it is most commonly of the singular number, as *the multitude is very noisy. The crowd is gone*, &c.

The second concord is between the substantive and the adjective. When you have an adjective, ask this question, who or what? the word that answers to the question, shall be the substantive to it. There is no distinction of case, gender or number in the application of adjectives to substantives in the English, as in Latin, as, *a comely lass, a dirty boy*, &c.

The pronouns *this* and *that*, make *these* and *those*, in the plural, as, *this man is my servant; these men are my servants; that book is my son's; those books are my daughter's*.

The adjective, for the most part is set before the substantive as, *a good boy*. Yet sometimes when there are more adjectives than one joined together, or one adjective with other words depending on it, the adjective may be set after the substantive, as, *a commander, both stout and brave*. And sometimes when the article *the* comes between, as *king George the third*, &c.

When two substantives are put together in composition, the first takes to itself the nature of an adjective; and is commonly

commonly joined to the following substantive by a hyphen, as, *a water-cask, a sea-horse, &c.*

Adjectives are frequently used as substantives, as *some, for some men; few, for few men.*

The third concord is between the antecedent and the relative. When you have a relative, ask this question, *who or what?* and the word that answers to the question shall be the antecedent to it.

A relative sentence is that which has in it the relative adjective, *who* or *which*. And the antecedent is the word going before the relative, and is rehearsed again of it, as, *this is the bird which you brought home, i. e. which bird you brought home.* The relative agrees with the antecedent in number and person, as, *that man is wise, who speaketh few things.*

When there comes no nominative case between the relative and the verb, the relative shall be the nominative case to the verb, as, *wretched is he who is in love with money.*

### OF ABBREVIATIONS.

BY these we expeditiously express, or set down a word, by making some initial letter or letters, belonging to the word, to express it; as in the table following.

A. for answer, or afternoon	A. R. Anno Regni, in the
A. B. Arts Bachelor	year of the reign
A. Bp. Arch Bishop	Ast. P. G. Astronomy Professor at Gresham college
Acct. Account	Aust. Austin or Austria

Before I proceed to writing, I shall give you an insight of the stops and marks used in reading and writing.

*Of Stops, Marks, and Points used in Reading and Writing;  
with their Places and Significations.*

THESE are of absolute necessity; and great regard ought to be had to them, to avoid confusion and misconstruction, and for the better understanding of what we read and write ourselves; and are likewise of use to others who shall hear us read, or see our writing: they teach us to observe proper distances of time, with the necessary raising and falling of the tone or voice, in reading, and the needful stops or marks to be used in writing, that we may understand it ourselves, and that our meaning may not be misunderstood or misapplied by others.

Stops, or pauses, considered as intervals in reading, are no more than four; though there are other marks to be taken notice of, but to other purposes: the names of the four stops are, a *comma*, *semicolon*, *colon*, and *period*, or *full stop*; and these do bear to one another a kind of progression of time; for the *comma* signifies a stop of leisurely telling one, the *semicolon* two, the *colon* three, and the *period* four.

— And are made or marked thus:

*Comma* (,) at the foot of a word.

*Semicolon* (;) a point over the comma.

*Colon* (:) two points.

*Period* (.) a single point at the foot of a word.

, *Example of the comma.*) There is not any thing in the world, perhaps, that is more talked of, and less understood, than the business of a happy life.

; *Example of the semicolon.*) It is not a curse that makes way for a blessing; the bare wish is an injury; the moderation of Antigonus was remarkable.

: *Example of the colon.*) A sound mind is not to be shaken with popular applause: but anger is startled at every accident.

. *Example of the period.*) It is a shame, says Fabius, for a commander to excuse himself, by saying, I was not aware of it. A cruelty that was not only fit for Marius to suffer, Sylla to command, and Catiline to act.

By the examples foregoing, we may easily note, that a *comma* is a note of a short stay between words in the sentence; and therefore the tenour of the voice ought to be kept up.—  
The *semicolon* is a little longer, and the tone very little abated.—

bated.—The *colon* signifies perfect sense, though not an end of the sentence; and the voice a little abated, or let fall.—The *period* denotes perfect sense, and the end of the sentence.

? When the question is asked, there is a crooked mark made over the *period* thus ? and is called a note of interrogation: *example*, what could be happier than the state of mankind, when people lived without either avarice or envy? the time of pause for this stop, is the same with the *semi-colon*.

! If a sudden crying out, or wondering be expressed, then this mark is made over the full stop, thus! and called a note of admiration, or exclamation: *example*, oh the astonishing wonders that are in the elementary world!

() If one sentence be within another, of which it is no part, then 'tis placed between two semicircles or parenthesis. made thus (): *example*, Pompey, on the other side (that hardly ever spake in public without a blush) had a wonderful sweetness of nature. Again; of authors, be sure to make choice of the best, and (as I said before) to stick close to them. Once more, honour thy father and mother (which is the first commandment with promise) that it may be well with thee.—In reading a parenthesis, the tone must be something lower, as a thing or matter that comes in by the bye, breaking in as it were in the main coherence of the period. The time is equal to a comma, and ought to be read pretty quick, lest it detain the ear too long from the sense of the more important matter.

' *Apostrophe* is a comma at the head of letters, signifying some letter or letters left out for quicker pronunciation, as *I'll*, for *I will*, *would'st* for *wouldest*, *shan't* for *shall not*, *ne'er*, for *never*, *is't*, for *is it*, *'tis* for *it is*, *i'th'* for *in the*, *o'er* for *over*: or to denote a genitive case; as, my father's house, or house of my Father; my uncle's wife, or wife of my uncle.

ˆ *Accent* is placed over a vowel, to denote that the stress or sound in pronunciation is on that syllable.

˘ *Breve*, or a crooked mark over a vowel, signifies it must be sounded short or quick.

^ *Caret* signifies something is wanting, and is placed underneath the line just where any thing, omitted by mistake or forgetfulness, &c. should be brought in.

*Cir-*

*Circumflex* is the same shape with the caret, but is placed over some vowel, to shew the syllable to be long, as *Eu-phrâ-tes*.

*Dialysis*, or two points placed over two Vowels, in a word, signifies they are to be parted, being no diphthong.

- *Hyphen*, or *note of connection*, is a strait line; which being set at the end of a line, shews that the syllables of that word are parted, and the remainder of it is at the beginning of the next line; and sometimes is used in compound words, as, *burnt-sacrifices*, *heart-breaking*, *soul-feeding*, *book-keeper*, &c. *N. B.* That when you have not room to write the whole word at the end of a line, but are obliged to finish it at the beginning of the next, such words must be truly divided, according to the rules of spelling; as, *restrain*, not *re-strain*. When the hyphen is placed over a vowel, it is properly a dash, and signifies the omission of *m* or *n*; 'tis much used in old Latin authors, and sometimes in English, especially in law business: *example*, it is very comendable to write a good hand.

☞ *Index*, is a note like a hand, pointing to something very remarkable.

\* *Asterism*, or *star*, directs to some Remark in the margin, or at the foot of the Page. Several of them together denote something defective or immodest, in that passage of the author.

† *Obelisk*, is a mark like a dagger, and refers to the margin, as the asterism: and in dictionaries it signifies the word to be obsolete, or old, and out of use.

¶ *Paragraph*, denotes a division, comprehending several sentences under one head.

§ *Section*, signifies the beginning of a new head of discourse, and is used in sub dividing a chapter, or book into lesser parts or portions.

[ ] *Brackets*, or *crochets*, generally include a word or sentence, explanatory of what went before, or words of the same sense, which may be used in their stead.

“ *Quotation*, or *double comma reverse*, is used at the beginning of the line, and shews what is quoted from an author to be his own words.

Thus much for pointing, stops, and marks; which, if carefully heeded and observed, will add grace and credit to your writing.

*An INTRODUCTION to the ART of*

W R I T I N G.

**H**AVING given you a sketch of grammar, I shall here endeavour to explain to you, in a short and concise manner, the method to write well.

Having a book ruled, and being furnished with a good pen, lay your book directly before you; place your body straight, with your right elbow towards your side, but not so close as to touch it; hold the pen with the hollow directly downwards, between the thumb and fore finger; the joint of the thumb extending outwards, so that the tip of your thumb may be as much higher than your fore-finger, as the end of your fore-finger is above the end of your middle-finger; your fore-finger lying close on the top of the pen, and your middle-finger almost strait, and all of them so as that you may extend or draw them in at pleasure. Rest your hand on the end of your little finger, and do not grasp the pen too hard, nor hold it too upright or slooping, but let it rest between the second and third joints of your fore-finger, with the nib not so far from the end of your fingers as to weaken your command, nor so near as to ink them.

Stay your book with your left hand, letting your left elbow rest on the table or desk, not touching them with your breast, but sit free and easy, avoiding all ill habits.

Thus being placed in a proper manner, with the pen held as before directed, first begin to make a small *o*, then *a*, *c*, *d*, *g*, *q*, and *x*.

Having formed a proper idea of these letters, all which depend on *o*, proceed next to the *i*, then to its dependants *j*, *m*, *n*, *p*, *r*, *t*, *v*, *u*, *w* and *y*.

These being formed in your memory, next go on to *l*, then to *b*, *h*, *f*, *s*, and so to *z*, and *x*. In this manner will you attain the knowledge of the whole alphabet.

Being perfect in making single letters, next proceed to half joining, which is the joining each single letter to *m*, *as*, *am*, *lm*, *em*, &c.

Next proceed to three letters, *as*, *and*, *but*, *cap*, &c.

Having a perfect knowledge of these, next learn capitals or great letters; and be sure be perfect in one thing, before you go to another. And observe these rules,

## 2.2 *Youth's faithful Monitor : Or*

1. The heads of all letters which have not stems and tails, are of the same height at top and bottom.
2. Those with stems above, as *l*, *k*, &c. are equal in length.
3. Those below the line equal as *j*, *y*, &c.
4. The heads and tails of letters must not run into one another; therefore let your lines be distant from each other somewhat more than twice the length of the heads or tails.

Lastly, Let your writing have a proper slope, and lean one way in round hand and Italian; and let your distance between word and word, be double to that between letters; and all strokes drawn down-right, must be full; and all strokes carried upwards, or cross, must be fine.

Learn first the alphabet of letters small,  
And then proceed to letters capital;  
Make all your joinings with a fine hair stroke,  
View well your copy, sit streight to your book;  
Write not too fast, but make your letters well,  
You'll be commended if you do excel.

### *How to make a Pen.*

**T**AKE the first, second or third quill in the wing of a goose or raven, clip and clean the best; when you have scraped off the thin rind thereof, with the back-edge of your pen-knife, hold it in your left-hand with the feather end from you, then enter the back thereof sloping, and cut off as much in length, as the quill is in breadth, and answer that with another cut on the inside, opposite to the former; then turn the quill, and enter the edge of your pen-knife even in the back thereof, and exactly in the midst of the half-round, neither inclining the blade one way or other, that the slit may not be made awry; then put in the peg of your knife haft (if it has one for that purpose) or the end of a whole quill, and with a sudden twitch force up the slit, holding your left-hand thumb hard upon the back of the quill, to put a stop how far the slit shall go. This being done, enter your knife sloping in the other side above the slit, about three times the breadth of the quill, and cut away the cradle piece; then turn the back upwards, and cut down to the end of the slit, the cheek or shoulder-pieces; and

and in so doing, turn the knife on both sides towards the back. After this, place the inside of the end or nib of the pen, upon the nail of your left hand thumb, holding the quill fast between the fore finger and middle of that hand. Lastly, to finish the nib, enter the edge of the knife on the back, and near the end thereof sloping, and immediately turning the edge almost downright, cut it off.

There are four considerations belonging to the quill.

1. If the quill be too hard, steep it a while in water.
2. If it be too soft, harden it with embers.
3. If it be too thick, pare a small quantity from the back of the nib.
4. If it be too thin and weak, strengthen the pen with a short slit, a short nib, and broad shoulder.

*A Receipt for the best Black Ink.*

TO six quarts of rain or river water, (but rain water is the best) put one pound and a half of fresh blue galls of Aleppo, (for those of Smyrna are not strong enough) bruised pretty small; eight ounces of copperas, clean, rocky and green; eight ounces of clean, bright and clear gum arabick; and two ounces of roch allum: let these stand together in a large stone bottle, or clean stone pot, or earthen pot, with a narrow mouth to keep it free from dust; shake, rowl or stir it well once every day, and you will have excellent ink in about a month's time, and the older it grows, the better it will be for use.

*Ingredients for a Quart.*

One quart of water, four ounces of galls, two ounces of copperas, and two ounces of gum, mixed and stirred as above.

*To make London Ink-powder.*

TAKE ten ounces of the clearest nut-galls, bruise them, and sift the powder very fine, then add white copperas two ounces, Roman vitriol three ounces, gum arabick or sandarack an ounce, bruise and sift them very fine, so that though they appear white, a little being put into water, will in a little time turn it, and an ounce of powder will make a pint of very black ink.

*To make Japan or Shining Ink.*

**T**AKE gum arabick and Roman vitriol, of each an ounce, galls well bruised a pound, put them into rape vinegar, or vinegar made of clear small beer; let them remain in a warm place, often stirring, till the liquor becomes black, then add to a gallon an ounce of ivory black and a quarter of a pint of seed-lac-varnish, and it will be a curious black shining ink.

*A Powder-Ink to rub on Paper and write on.*

**B**RUISE about twenty nut galls, and half an ounce of Roman vitriol, as much gum arabick, and gum sand-rack, mingle these finely together, when well bruised and sifted to a powder; rub the paper hard with it with cotton-wool, and polishing it with a piece of ivory, write with water, and in a little time the letters you write will appear a fair black, as if written with the best ink.

*How to make Red Ink.*

**T**AKE three pints of stale beer, rather than vinegar) and four ounces of ground brazil wood; simmer them together for an hour; then put in four ounces of rock alum; and these three are to simmer together for half an hour; and then strain it through a flannel or rag; then bottle it up, and stop it down till used.

*To keep Ink from Freezing or Moulding.*

**I**N hard frosty weather, ink will be apt to freeze; which if once it doth, it will be good for nothing; for it takes away all its blackness and beauty: to prevent which, (if you have not the conveniency of keeping it warm, or from the cold) put a few drops of brandy, or other spirits, into it, and it will not freeze. And to hinder its moulding, put a little salt therein.

**COPIES for WRITING:**

Single Line Copies in Prose, in Alphabetical Order.

A

**A**CQUAINTED ever be with good society.  
A virtuous woman is a crown to her husband.

A blind man's wife needs no painting.  
A good beginning often ends well.  
A harlot's breath is the gate of death.  
Art hath no greater enemy than ignorance.

B

Brave minds endure pain, contemn pleasure.  
By hammer and hand all arts do stand.  
Beauty fadeth soon, like a rose in June.  
Be virtuously inclin'd in body soul and mind.  
By constant amendment we rise to preferment.  
Bear always greatest love unto thy God above.

C

Contentment is the greatest of moral virtues.  
Conceitedness of ourselves is a great fault.  
Courage overcomes the greatest difficulties.  
Content is to be valued above all things.  
Courtesy and humility are marks of gentility.  
Contentment is a kingdom to the mind.

D

Death will comfortably end a well spent life.  
Delights, like physicians, leave us when dying.  
Demean yourself prudently in every company.  
Discreet let thy choice be of good society.  
Do unto others as thou would'st be done unto.  
Diligence and ingenuity are handmaids to art.

E

Experience is a good thing if not bought too dear.  
Envious men become their own tormentors.  
Empty vessels make the greatest sound.  
Evil communications corrupt good manners.  
Eternal joy remains to good men after pains.  
Every purpose is established by good counsel.

F

Fear of death is worse than death itself.  
Fair words are oft a cloak for bad actions.  
Faith represents to thee a near eternity.  
Faith is a gift divine, it makes the soul to shine.  
Frequent commission of sin hardens men therein.  
Friendship is mortal, but enmity immortal.

G

Good manners will procure respect at all times.  
Go, sluggard, to the bee, and see her industry.

D

Grief

Grief may shorten life as much as a disease.  
Government cannot be maintained without rule.  
Great things may fall by causes small.  
Glory is a great incitement to worthy actions.

## H

Honour and virtue are the ornaments of the soul.  
Honour father and mother, love sister and brother.  
How lovely it is to see brethren to agree.  
Humility is the Highway to honour.  
He enjoys enough who wants no more.  
Humility of mind is a virtue most excellent.

## I

In all friendship endeavour to avoid flattery.  
Ingenuity is owing to nature, learning to education.  
Idleness procures poverty, and laziness want.  
In time of wealth despise not thy poor relations.  
Industrious ever be to prevent misery.  
In bearing witness never tell a lye.

## K

Knowledge and learning are preferable to riches.  
Kind speeches comfort the soul in heaviness.  
Kings may command but subjects must obey.  
Knowledge of ourselves requires great penetration.  
Keep in remembrance the commands of God.  
Know thy Creator in the days of thy youth.

## L

Learn to employ and well improve your time.  
Love makes the foulest things seem fair.  
Learn by others vices how filthy are your own.  
Let thy life sober be; strive for felicity.  
Learning is pleasant to an industrious mind.  
Learn to live in love like the harmless dove.

## M

Manners with learning make a gentleman.  
Make no friendship with an angry man.  
Momentary pleasures are fading treasures.  
Much might be mended if carefully minded.  
Many are the misfortunes of this mortal life.  
Make not a jest at another man's infirmity.

## N

No man mortal can see God immortal.  
Nothing is hard to a willing mind.

None are so deaf as they that will not hear.  
Necessity is the mother of invention.  
Never take in vain thy Maker's holy name.  
Nothing can satisfy souls but the Deity.

O

Opportunity neglected brings severe repentance.  
Opinion guides some men contrary to reason.  
Our highest wisdom is to get eternal bliss.  
Opportunity once lost is not easily regained.  
Overcome thy propensity and proneness to vice.  
Our love and charity God crowns eternally.

P

Perplexing cares do cause grey hairs.  
Prize opportunity, improve it prudently.  
Patience is a remedy for every misfortune.  
Pry not into the secret affairs of other men.  
Prudence, patience, and piety are excellent graces.  
Pray fervently each day to God to guide thy way.

Q

Quietness is commonly crowned with content.  
Quantity without quality is nothing.  
Quarrelsome persons are unsociable companions.  
Quiet minds commonly enjoy content.  
Quiet and patient be when God afflicteth thee.  
Quarrels avoid, and fly from all bad company.

R

Religion and reason are guides to happiness.  
Riches too oft swell the mind with pride.  
Remember thy last end; daily thy life amend.  
Repentance is the consequence of wicked actions.  
Rejoice not when thine enemy stumbleth.  
Return the kindnesses that you receive.

S

Sin is the breach of God's commandments.  
Sin and misery are the portion of mankind.  
Shame, woe, and misery attend all villainy.  
Service willingly offered is commonly refused.  
Shun idleness and fly from ill society.  
Security is the forerunner of calamity.

T

The glory of a good man is a good conscience.  
The consequence of vice is ruin and destruction.

D 2

Trust

Trust in the Lord with all thine heart.

The fear of the Lord is the beginning of wisdom.

Thy joys should rest in thine own breast.

Time slides insensibly away without returning.

## V

Vain compliments are but equivocations.

Vulgar persons often form a wrong judgment.

Virtue is higher rais'd when it's extol'd and prais'd.

View well your copy, sit straight to your book.

Vanity is written upon all earthly enjoyments.

## U

Undertake nothing without due consideration.

Use and due exercise do art familiarize.

Use thy time carefully, think on eternity.

Unmannerly manners discredit their owners.

Use honest industry and God will thee supply.

## W

What God hath will'd shall be fulfill'd.

Wealth gotten by vanity, shall be diminished.

We should bear patiently deserved misery.

Wise men conceal their own private misfortunes.

Wisdom and virtue are the beauties of the soul.

Whoso mocketh the poor reproacheth his Maker.

## X

Xenocrates commended virtuous employments.

X, when it stands alone, for ten is to be known.

Xerxes's mighty host was overthrown and lost.

Xerxes commanded many thousand Persians.

Xenophon and Plato were great philosophers.

X commandments contain our whole duty.

## Y

Youth well instructed will hardly err.

Young men want experience to guide their actions.

Your precious time strive to spend well.

Youth subject is to pride and to despise a guide.

You must not steal nor take another's right.

## Z

Zeal with sincerity shuns all hypocrisy.

Zealous and constant be in love and charity.

Zealously strive your fellows to excel.

Zeal in a good cause is commendable.

Zeno chose silence before any other virtue.

*Note,* A necessary Qualification for Youth, is to imitate Print, that they may  
make neat Letters on Bales, Parcels, &c.

*th's faithful Monitor: Or*

g thoroughly improved yourself in writing  
be necessary to apply yourself to letter writing  
done generally renders it familiar, you should  
write upon different subjects, and great care  
n to spell and point well. Is is most agreeable  
r of tautology in them should be avoided.  
ey of instances would be unnecessary, I have  
you a sketch of a few letters upon different sub-  
ray of example.

*A Letter of Thanks from a Son to a Father.*

*My dear Father,*

I am very glad to hear by Mr. Franklin, who arrived here  
of your bad state of health, and shall be very  
glad to receive a letter of your amendment. I thank  
you very much for the *Youth's faithful monitor: or, the  
best companion*, that you sent me, and propose  
to peruse it, especially as the instructions contain-  
ed are so useful and edifying. Pray remember my  
mother, with love to my sisters.

*I am, honoured Sir,*

*Your most dutiful son*

James Green.

*The Father's Answer.*

*Dear Son,*

**Y**OURS I received on Tuesday last, and now acquaint  
you that I am much better. Mr. Franklin informs  
me that he has enquired of your master how you improve in  
your learning: I am very glad to hear of your proficiency,  
and hope that by a constant perseverance, you will in time  
be a scholar. Believe me, child, a man without learning  
seldom makes a figure in the world, and as no attainment  
can be made without some difficulty, I hope you will be  
assiduous for the little time you have to remain at school. I  
have wrote to your master concerning your choice of books;  
and, as he knows your capacity, I am sensible he'll spare no  
pains to improve you.

*I am, dear child,*

*Your loving father,*

Ambrose Green.

*From*

## *The Young Man's best Companion.*

*From a nephew to his uncle on business.*

*Honoured Uncle,*

ACCORDING to your desire before we parted, I have made all the enquiry I possibly could to trace the author that spread the report of your leaving off business. I am informed that it was your late apprentice, that served his time with you; who did it with the intention to gain your customers from you. But I have diligently been with them all, and convinced them that there was no room for any such report. Mr. Quill, the attorney, informs me, that it will bear an action; but knowing that you was not of a litigious disposition, gave no particular orders to bring the person to justice. Whatever further commands you chuse to lay on me, shall be ready at all times most punctually to comply with. I am,

S I R,

*Your obedient nephew,  
And humble servant,*

James Pine.

*The uncle's answer.*

*Nephew,*

I Am glad to hear you have found out the person that endeavoured to prejudice me in trade; but of all the world I little suspected the lad whom I ever treated in his apprenticeship like a child of my own. As to law, I am not fond of it, but shall take an opportunity of reproaching him with it openly, the first time I see him, and then leave him to himself, to receive the reward due to him for his ingratitude. I remain

*Your loving and affectionate uncle,*

Isaac Jones.

*From a niece to her aunt.*

*Madam,*

THE kind treatment I met with from you, during the time I tarried with you in the country, can never be too gratefully acknowledged by me. I have informed my father and mother that you every day contributed to find out fresh amuse-

*YOUTH'S FAITHFUL MONITOR: OR*

amusements for me, and not alone contented with that, was continually loading me with fresh presents. The country was by your means rendered so agreeable to me, that I could have lived there forever. But as my mother required my assistance in town, I thought my obedience ought, as a part of my duty, to give way to my pleasure. I am, Madam,

*Your most respectful niece,*

*And very humble servant,*

Jane Johnson.

*From a sister in the country to her brother in London, complaining of his not writing.*

*Dear Brother,*

THE pain you have given me by your long silence, is almost, I may say, inexcusable. Could you but know the anxiety I have had in regard to all your welfares, you would not have neglected writing. But as I am inclinable to think that the hurry of business has prevented it, which if it be the case, you are not so much to blame. However, I beg I may hear from you soon, that I may not totally accuse you of ingratitude. Pray give my duty to my papa and mama, and tell them, that as soon as the fine weather comes on, my uncle and aunt will expect them in the country. My love to my sister, and compliments to all friends.

*I am, dear brother,*

*Your loving sister,*

Mary Hill.

*The answer.*

*Dear sister,*

Yours I received, and should still have been happy to conceal the sorrowful news from you; but a christian-like patience under afflictions, is a commendable Virtue. Not to keep you long in suspense, your poor sister is no more. I have endeavoured to comfort my father and mother under their misfortune, by telling them it is their duty to submit, and to think themselves happy in having a son and daughter yet left. In return they plead to me the promisingness of her youth, the virtues of her mind

and the genius of her understanding, makes their loss unsupportable. Had you been at home, you'd have been surprised to see with what fortitude she met the king of terrors; and as the sight was too shocking for father and mother to sustain, I and the nurse remained in the room until she expired; which she did with a patience truly laudable: But here, my dear sister, suffer me to draw a curtain over this gloomy scene. My father and mother send their blessing to you, as all friends do their love. Assure yourself,

*I am, dear sister,*

*Your afflicted brother,*

Peter Hill.

*A Letter with a Present.*

*My dear friend,*

NOT to acknowledge the favours I have received from you, would be the greatest ingratitude. I have in return sent you a small present, as a token of my friendship; which I hope will be no ways unacceptable to you. As this country abounds with variety of game, and having heard you say you were very fond of it, I hope the hare and partridges will be acceptable. I should be glad of a line from you when it suits, and, depend upon it, you may at all times command,

*My dear friend,*

*Your humble servant,*

David Stanley.

*A letter from a Gentleman at Lisbon, to his Son in London.*

*Dear son,*

BEFORE you receive this from your unhappy father, you will have heard of the destruction of this place, and of the calamitous situation of its few remaining miserable inhabitants. God in his infinite mercy protect us! All that you have heard will fall far short of what I have seen, for no words have energy sufficient to convey an idea of a scene so amazingly dreadful—Your poor mother no longer exists! Ask me not for your sisters! And as for myself, I am a vagabond, and condemned to seek my bread from those who can ill afford to feed me. But the Lord gave, and the Lord

*Lord has taken away*—I am satisfied—All may be for the best, and our friends are, I doubt not, removed to a more permanent city, whose foundations are not to be shaken, and where sorrow is no more. Let us, my dear child, prepare to follow them; and that we may do so let us live here that we may fear no dissolution, nor dread what may happen hereafter. Let us always be prepared for the worst, and not depend on a death bed repentance; for you see we have not a moment that we can call our own. St. Austin says, *We read of one man, that was saved at the last hour, that none may despair; and of but one, that none may presume.* How unsafe, how foolish therefore is it to put off that till to-morrow, which is so essentially necessary to be done to-day? To-morrow may never come! O think of that! You may be snatched away in an instant, as thousands here have been, for there is no withstanding the arm of the Almighty: No; the attempt would be vain, would be presumptuous, would be impious; and you will find, my dear son (I hope not too late) that the only security against accidents of this sort, is the leading a religious and good life. I am

*Your truly affectionate father,*

Henry Small.

*From a Servant to his Master upon Business.*

Sir,

AS you have continued in the country longer than you expected, I think it a necessary part of my duty to inform you that nothing has been neglected: I have received the goods from Coventry that you informed me of, and the best part of them are disposed of. I have used my utmost diligence to oblige your customers; and have observed the greatest punctuality in your books, which I hope upon your return, you'll find to your satisfaction. If any thing occurs to me contrary to your expectations, you may depend upon being informed of it, from, Sir,

*Your most dutiful servant,*

P. S. I have settled  
with Mr. White,  
much to his satisfaction.

Timothy Looksharp.

Having

*The Young Man's best Companion.* 35

Having given you a form for writing letters upon different subjects, it is necessary to shew you how to superscribe them, in order that due respect may be paid to your superiors.

TERMS of ADDRESS,

*To the Royal Family.*

To the King's most excellent Majesty. Sire, or, May it please your Majesty.

To his Royal Highness *William*, Duke of *Cumberland*. May it please your Royal Highness.

*To the Nobility.*

To his Grace the Duke of *S*. My Lord Duke; your Grace.

To the most noble *Peter*, Marquis of *R*. My Lord Marquis; your Lordship.

To the Right Hon. *John*, Earl of *L*. My Lord; your Lordship.

To the Right Hon. *J*. Lord Viscount *M*. The same.

To the Right Hon. *P*. Lord *O*. The same.

Here observe that noblemens wives are addressed equal to their husbands dignity.

That all the sons of *Dukes* and *Marquisses*, and the eldest sons of *Earls*, have the titles of *Lord* and *Right Honourable*, by the courtesy of *England*.

To the sons of *Viscounts* and *Barons* are given the titles of *Esquires* and *Honourable*; and that of *Honourable* likewise to their daughters but without any other addition.

Every *Gentleman*, in any place of honour or trust, is styled *Honourable*, but no *Commoners* (those of his Majesty's privy-council), the lord mayors of *London*, *York* and *Dublin*, and the lord provost of *Edinburgh*, for the time being, excepted) are styled *Right honourable*.

Lastly, every considerable *Servant* to his Majesty, the Prince of *Wales*, or any other of the *Royal Family*, is, whilst on the civil and military list, distinguished by the title of *Esquire*.

*To the Parliament.*

To the Right honourable the Lords spiritual and temporal, in Parliament of *Great Britain* assembled. My Lords; May it please your Lordships.

To the Hon. the knights, citizens and burgessees, in parliament

liament of *Great Britain* assembled. Gentlemen; May it please your Honours.

To the Right Honourable Sir *A. C.* Speaker of the honourable house of commons. Sir; or if he be a Lord, May it please your Lordship.

*N. B.* He is for the most part a member of the privy-council.

*To the Clergy.*

To the most Reverend Father in God, *A.* Lord Archbishop of *C.* or *F.* My Lord, your Grace.

To the right reverend Father in God, *O.* Lord Bishop of *L.* Right reverend Sir.

To the Rev. Mr. or Dr. (according to their Station) *A. Z.* Dean of *B.* Chancellor of *C.* Archdeacon of *D.* Prebendary of *E.* Rector of *F.* Vicar of *G.* Curate of *H.*

The general term to these is Sir; but to a Dean or Archdeacon we say, Mr. Dean, or Mr. Archdeacon.

All rector, vicars, curates and clergymen of other inferior denominations, are stiled Reverend.

*To the Officers of his Majesty's Household.*

To these we address for the most part according to their quality, but sometimes according to their office, as, My Lord Steward, My Lord Chamberlain, &c.

*To the Commissioners, &c. on the civil List.*

To the Right Hon. *A.* Earl of *B.* Lord Privy Seal—Lord President of the Council—Lord Great Chamberlain—Earl Marshal of *England*—One of his Majesty's Principal secretaries of state, &c. My Lord; or May it please your Lordship.

To the Right Hon. the Lords Commissioners of the Treasury—of the Admiralty, &c. The same.

To the Hon. the commissioners of his Majesty's Customs—Revenue of Excise, &c. May it please your Honours.

*To the Soldiery.*

To the Right Hon. *A.* Earl of *B.* Capt. of his Majesty's first Troop of Horse Guards—Band of Gentlemen Pensioners, &c. To *A. B.* Esq; Lieutenant General—Surveyor General of the Ordnance, &c. Your Honours.

*To the Officers of the Navy.*

To his Grace *A.* Duke of *B.* Lord High Admiral of *Great Britain.* Your Grace.

*The Young Man's best Companion.* 37

To vice-admirals, rear admirals and captains. Sir, or Your Honour; except they be noblemen.

*To the Ambassador.*

To his Excellency Sir *A. B.* Bart. Envoy Extraordinary from his *Britannic* Majesty to——Ambassador to——his Resident at, &c. Your Excellency.

To Secretaries and Consuls. Sir.

*To the Judges and Lawyers.*

To the Right Hon. *A.* Baron of *B.* Lord High Chancellor——Master of the Rolls——Lord Chief Justice of the King's Bench——Common Pleas. My Lord, your Lordship; and to such as are only honourable——Sir, May it please you Sir: And the same to all other Graduates in the Law.

*N. B.* Every Barrister is stiled Esquire.

And all such Gentlemen as are in commission of the peace, are also stiled Esquires, and addressed to as worshipful; as are also Sheriffs and Recorders.

The Aldermen and Recorder of the City of London, and all Mayors of Corporations (the Lord Mayor only excepted) have the Title of Right Worshipful.

Governors of Hospitals, Colleges, &c. are stiled Right Worshipful, or only Worshipful, according as their respective titles may be.

Bodies Corporate are stiled Honourable, and sometimes Worshipful.

A Baronet and a Knight are for the most part stiled Honourable, and their Wives have the Title of Ladies.

As to the address made to Merchants, and other persons in Trade, it is only Sir.

*Sundry Forms of Receipts and Promisory Notes.*

*per James Tradewell.*

---

£. 90

---

A promisory note, mentioning order, is indorsable from one person to another, which is done by the present possessor's writing his name on the Back of it, and delivering it up to the party to whom he intends to assign over his property therein.

The delivering up a promisory note to the person who signed it, is a sufficient voucher of its being paid; nor is there need of writing a receipt thereon.

Promisory notes and book debts, if not legally demanded in the space of six years, cannot be recovered by law upon the Debtors pleading the statute; but they are recoverable in Chancery.

If you keep a promisory note, on demand, in your own hands above three days, and the person it is upon should fail, the loss will be your own; but if he fails within three days it will light in equity on the person that paid it you.

*A. B.* Observe in promisory notes that the value received is mentioned, or they are of no force, and likewise the time of payment.

*Precedents in law and business that persons in general ought to be acquainted with.*

*A BILL of DEBT.*

KNOW all men by these presents, that I Paul Bell, of the county of Durham, Gent. do own and acknowledge myself justly to stand indebted to Abraham Smith, of the county of York, haberdasher, the just sum of thirty pounds of good and lawful money of Great Britain, and which I do hereby promise to pay unto him, the said Abraham Smith, on the 17th of May, next ensuing the date hereof. Witness my hand this 24th day of May, in the year of our Lord 1765.

Paul Bell.

*ANOTHER.*

Memorandum, that I Philip Spendall, of the parish of St. Ambrose, Salter, do owe, and am indebted to Samuel Rogers of the said place, mercer, the sum of ninety-nine pounds of good and lawful money of Great Britain, which sum I promise to pay to the said Samuel Rogers, his executors, administrators, or assigns, on or before the 18th

day of May next. In witness whereof, I have set my hand and seal the 25th day of May, in the year of our Lord, 1765.

Philip Spendall.

Signed, sealed, and delivered,

(being first legally stamped)

in the presence of

John Jones, Matthew Derby.

*A form of a will, a man having no children.*

**I**N the name of God. Amen. I Peter Baronet, of \_\_\_\_\_ in the county of \_\_\_\_\_ Yeoman, being of sound and disposing mind and memory, do make and ordain this my last will and testament in manner and form following; that is to say, *Imprimis*, I will that all my debts and funeral charges be paid and discharged by my Executrix, herein after named: Item, I give and bequeath unto my cousin \_\_\_\_\_ of \_\_\_\_\_ the sum of 12 pounds of lawful money of Great Britain. Item, I do give and demise unto \_\_\_\_\_ my brother's son, all that cottage or tenement, situated in the parish of \_\_\_\_\_ in the county of \_\_\_\_\_ now in the occupation of \_\_\_\_\_ in the close adjoining to it, to the said \_\_\_\_\_ his heirs and assigns forever. Item, I do give unto my loving wife, Sarah Baronet, all the rest of my goods and chattles, and personal estates whatsoever. Also I do give and demise unto Sarah my said wife, her heirs and assigns forever, all my lands and tenements lying in the parish of \_\_\_\_\_ in the county of \_\_\_\_\_ and now in the several occupations of \_\_\_\_\_ and \_\_\_\_\_ or their under tenants; and also the messuage or tenement situated in the parish of \_\_\_\_\_ in the said town of \_\_\_\_\_ and now in my own occupation, together with the orchard, and all other appurtenances thereunto belonging.

Lastly, I do make and constitute Sarah my said wife, executrix of this my last will and testament. In witness whereof I have hereunto set my hand and seal this day of \_\_\_\_\_ in the year of our Lord 1765.

P. B. O.

Signed, sealed, published and pronounced, by the said Peter Baronet, as his last will and testament, in the presence of us, who, in his presence, and the presence of each other, have hereunto subscribed our names.

R. P. A. R. H. O.

*A short will in a legal form.*

I **N** the name of God, amen. I A. B. of  
yeoman, being infirm in body, but in perfect health, do make and ordain this my last will and testament in form following: That is to say, I give and recommend my soul into the hand of almighty God that gave it, and my body I recommend to the earth to be decently interred at the discretion of my executrix. And touching such worldly estate which it hath pleased God to bless me with, I will and bequeath in the following manner and form.

I bequeath to M. B. my dearly beloved wife, the sum of five hundred pound-, of lawful money of Great Britain, to be raised and levied out of my estate; together with all my household goods, debts and moveable affairs.

Also, I give to my well beloved daughter H. B. whom I likewise constitute, make and ordain, the sole executrix of this my last will and testament, all and singular my lands, messuages and tenements, by her freely to be possessed and enjoyed; and I do hereby utterly disallow, revoke and disannul all and every other former testaments and wills by me in any ways before named, willed and bequeathed, ratifying and confirming this and no other to be my last will and testament. In witness whereof, I have hereunto set my hand and seal, this twelfth day of March, One thousand seven hundred and sixty-five.

Signed, sealed, published and pronounced by the said A. B. as his last will and testament, in the presence of us who, in his presence, and the presence of each other, have hereunto subscribed our names.

S. T.

W. I.

J. W.

The testator after taking off the seal, must in the presence of the witnesses, pronounce these words, *I publish and declare this to be my last will and testament.*

*Note.* Where a real estate is concerned, three witnesses are absolutely necessary to sign it; but where it is a personal estate only, two may do. The law excepts wills from the duties of the stamp office.

*A codicil, or schedule to a Will, made after a will is sealed.*

**B**E it known unto all men by these presents, that I A. B. of                      yeoman, have made and declare that my last will and testament in writing, bearing date, &c. I the said A. B. do by these presents contained in this codicil or schedule, confirm and ratify my said last will; and do give and bequeath unto J. E. of, &c. and my will and meaning is that this codicil or schedule, be esteemed and adjudged to be part and parcel of my said will and testament, and that all things therein contained and mentioned, be faithfully performed in as full ample and perfect manner in every respect as if the same was so declared and set down in my said will. In witness whereof, I, the said A. B. have hereunto set my hand and seal the 30th of May, 1756.

A man may give his goods to any person by word of mouth, before three witnesses, before his death, but it is much more secure to do it by deed of gift in writing in some such like form as this following:

*A deed of gift of goods.*

**T**O all christian people, unto whom this present writing shall come, I A. B. of                      send greeting. Know ye that I the said A. B. for divers good causes and valuable considerations me hereunto moving, have given and granted, and by these presents do give, grant, and confirm unto C. D. of                      all and singular, my goods, chattels, household stuff, and all other my substance whatsoever, in whole hands, custody, possession, or keeping soever the same are, or can, or may be found. To have and to hold all and singular the said goods, chattels and household stuff whatsoever, of me A. B. unto the said C. D. his executors, administrators and assigns, from henceforth to his and their own proper use and uses, thereof and therewith to do, order, and dispose at his or their wills and pleasure, as of their own proper goods and chattels, freely and peaceably, and quietly, without any manner of lett, trouble or denial of me, the said A. B. or any other person or persons whatsoever, of all which premises, I, the said A. B. have put the said C. D.

in full and peaceable possession by virtue hereof. In witness whereof, I, the said A. B. have herunto set my hand and seal the 28th of May, Anno Domini, 1765.

Sealed and delivered (being first legally stamped) in the presence of

INDENTURE *for an* APPRENTICE.

THIS indenture witnesseth, that \_\_\_\_\_ son of \_\_\_\_\_, &c. doth put himself apprentice to \_\_\_\_\_, Shoe-maker, to learn his art or mystery, and with him after the manner of an apprentice to serve from the day of the date hereof, for and during the term of seven years next ensuing, during all which term the said apprentice his said master faithfully shall serve, his secrets keep, and all his lawful commands every where gladly do; he shall do no damage to his said master, nor see it to be done by others, without letting or giving notice thereof to his said master; he shall not waste his master's goods, nor lend them unlawfully to any. He shall not commit fornication, nor contract matrimony during the said term; he shall not play at cards, dice, or any other unlawful game, whereby his master may be damaged, with his own goods, nor the goods of others; he shall not absent himself day or night from his said master's service unlawfully; or haunt ale houses, taverns, or play-houses; but in all things behave himself as a faithful apprentice, in the trade or mystery he now followeth; and the said master shall procure and provide for him sufficient meat, drink, apparel, lodging, washing and all other necessities, during the said term. And for the true performance of all and every the said covenants and agreements, either of the said parties bindeth himself unto the other firmly by these presents. In witness whereof, they have interchangeably set their hands and seals hereunto, this 20th day of September, in the 5th year of the reign of our sovereign lord George III. king of Great Britain, France and Ireland, &c. and in the year of our Lord God, 1765.

*The Form of a LETTER of ATTORNEY, to execute  
a particular Business.*

KNOW all men by these presents, that I, A. B. of C,  
in the county of D, yeoman, for divers good causes  
and

and considerations, me hereunto moving, have made ordained, constituted and appointed, and by these presents, do make, ordain, constitute and appoint my trusty friend I. K. of M. gent. my true and lawful attorney, for me, in my name and to my use, to ask, demand, recover and receive of and from B. C. of, &c. the sum of, &c. giving, and by these presents, granting to my said attorney my sole and full power and authority, to take pursue and follow such legal courses for the recovery, receiving and obtaining of the same, as I myself might or could do, were I personally present; and upon the receipt of the same, acquitances, or other sufficient discharges for me, and in my name, to make, sign, seal and deliver; as also one or more attorney or attorneys under him to substitute and appoint, and again at his pleasure to revoke; and farther to do, perform and finish for me, and in my name, all and singular thing or things, which shall or may be necessary, touching and concerning the premises as fully, thoroughly, and entirely, as I the said A. B. in my own person might, or could do, in or about the same; ratifying, allowing, and confirming whatsoever my said attorney shall lawfully do, or cause to be done, in and about the execution of the premises, by virtue of these presents. In witness whereof, I have hereunto set my hand and seal, the 12th day of September, in the 5th year of the reign of our sovereign lord George III. by the grace of God, king of Great Britain, &c. and in the year of our Lord God 1767.

#### REVOCATION of a LETTER of ATTORNEY.

**KNOW** all men by these presents, that whereas I  
of in the county of  
yeoman, upon the trust and confidence which I had in  
of, gent. by letter of attorney under  
my hand and seal, bearing date did make, ordain,  
constitute and appoint the said my lawful at-  
torney, for me, and in my name, and to my use, to ask, de-  
mand, recover and receive, of and from  
bookseller, the sum of, as thereby  
more at large may appear: now know ye, that I the said

for divers good causes and considerations me here-  
unto moving; have, and by these presents do revoke, dis-  
annul and make void the said letter of attorney, and all power  
and

and authority, therein to him the said given.  
In witness, &c.

*LETTER of ATTORNEY from a SEAMAN.*

KNOW all men by these presents, that I, mariner, now belonging to his majesty's ship the *Ann*, for divers good causes and considerations me hereunto moving, have, and by these present do make, ordain, constitute and appoint my trusty friend, , citizen and baker of Bristol. my true and lawful attorney for me, and in my name, and for my use, to ask, demand and receive of and from the right honourable the treasurer or paymaster of his majesty's navy, and commissioners for prize money, and whom else it may concern; as well all such wages and pay, bounty-money, prize-money, and all other sum and sums of money whatsoever, as now are, and which hereafter shall or may be due or payable unto me; also all such pensions, salaries, smart-money, and all other monies and things whatsoever, which now, or at any time hereafter may, or shall be due to me for my service, or otherwise. In any of his majesty's ship or ships, frigates or vessels: giving and hereby granting unto my said attorney full and whole power to take, pursue, and follow such legal ways and courses for the recovery, obtaining, and discharging the said sum and sums of money, or any of them, as I myself might, or could do, were I personally present. And I do hereby ratify, allow, and confirm all and what soever my said attorney shall lawfully do, or cause to be done, in and about the execution of the premises, by virtue of these presents. In witness, &c.

*A B O N D.*

KNOW all men by these presents, That I, (Robert Scott, in the county of Durham, merchant) am held, and firmly bound unto (James Syms of Doncaster, in the county of York, Esq;) in the sum of (two hundred) pounds of good and lawful money of Great Britain, to be paid to the said (James Syms) his heirs, executors, administrators, or assigns: to which payment, well and truly to be made, I bind myself, my heirs, executors, administrators, or assigns, firmly by these presents. Sealed with my seal. Dated the (first day of June) in the 5th year of the reign of our sovereign lord (George

(George III.) by the grace of God, king of Great Britain, France and Ireland, defender of the faith, and in the year of our Lord God, (1765)

### *The* C O N D I T I O N.

**T**HE Condition of this obligation is such, that if the above bounden (Robert Scott) his heirs, executors, or administrators, do well and truly pay, or cause to be paid, unto the above mentioned (James Syms) his executors, administrators, or assigns, the full sum of (one hundred) pounds, with lawful interest for the same, of good and lawful money of Great Britain, on the (first day of January next) ensuing the date hereof; then this obligation to be void, or else to remain in full force.

Robert Scott.

Sealed and delivered (being  
first legally stamped) in  
presence of  
F. G. H. I.

When a bond is given in consideration of the value received, the bond is always to be made for double the value in the condition.

What is to be varied, and made agreeable to the circumstances before you, is in those words inserted between ().

### A B I L L of S A L E.

**K**NOW all persons whom it may concern, That I [John Trader of Kendal, in the county of Westmoreland, weaver] for and in consideration of the sum of [one hundred pounds] of lawful money of Great Britain, to me in hand paid, by [Daniel Dike, of London, Esq; the receipt whereof I do hereby acknowledge, have bargained, sold and delivered, and by these presents according to the due form of law, do bargain, sell, and deliver unto the said [Daniel Dike] 4 pieces of Kendal cotton; one hundred pair mens hose, five womens ditto, fifteen boys ditto, sealed up with my seal; to have and to hold the said bargained premises, unto the said [Daniel Dike] his executors, administrators, and assigns for ever.— And I the said [John Trader] for myself, my executors and administrators, the said bargained premises unto

the said [Daniel Dike] his executors, administrators and assigns, against all persons, shall and will warrant, and for ever defend, by these presents: [*If the bargained premises be redeemable by a limited time, a proviso of this nature is added.*] Provided, nevertheless, that if I the said [John Trader] my executors, administrators or assigns, or any of us, do, and shall well and truly pay, or cause to be paid unto the said [Daniel Dike] his executors administrators or assigns, the sum of [one hundred and three pounds] as principal and Interest, lawful money of Great Britain, on the [thirtieth of October next ensuing the date hereof] for redemption of the bargained premises; then this present bill of sale shall be void, and of none effect; but if default be made in the payment of the said [one hundred and three pounds] in part, or in the whole, contrary to the manner and form aforesaid, that then it shall remain and be in full force and virtue. In witness whereof, I have hereunto set my hand and seal, the [twenty-ninth day of June] in the year of our Lord [1765.]

John Trade, [L. S.]

Sealed and delivered, &c.

#### A GENERAL RELEASE.

KNOW all men by these presents, that I, [Thomas Stevens of London, grocer] have remitted, released, and for ever quitted claim, and by these presents do for me, my heirs, executors and administrators, remise, release, and for ever quit claim, unto [Jeremiah Bucks, citizen and mercer of London] his heirs, executors and administrators, all and all manner of actions, cause and causes of actions, suits, bills, bonds, writings, obligatory debts, dues, duties, accompts, sum and sums of money, judgments, executions, extents, quarrels, controversies, trespasses, damages and demands whatsoever, both in law and equity, or otherwise howsoever, which against the said [Jeremiah Bucks] I ever had, now have, and which I, my heirs, executors and administrators, shall, or may have, claim, challenge or demand, for or by reason, or means of any matter, cause or thing, from the beginning of the world, to the day of the date of these presents. In witness whereof,

I have hereunto set my hand and seal, the [twelfth day of July] and in the year of our Lord [1765.]

Thomas Stivens. L. S.

Signed, sealed and delivered [being first legally stamped] &c.

## Of ARITHMETIC.

**H**AVING now given you a view of grammar, and the necessary precedents in law, &c. with different forms of various businesses, we come next to ARITHMETIC, the knowledge of which is so necessary, that scarce any thing in *life*, and nothing in *trade*, can be done without it :

Therefore, let it be observed, that all numbers are generally expressed by, or composed of these characters following, *viz.*

*One, two, three, four, five, six, seven, eight, nine, cypher.*  
 1    2    3    4    5    6    7    8    9    0

Nine of these are called significant figures, to distinguish them from the cypher, which of itself signifies nothing, but as it is placed (in whole numbers) serves to increase the value of the next figure or figures that stand before it, as 2 but two; but before the cypher thus 20, the two becomes twenty.

Any of the above nine figures or digits, have two values; one certain, and the other variable; the certain value is, when it stands by itself; the variable is when joined or placed with other figures or cyphers; for when any one of these figures stand alone, it signifies no more than its own simple value, as two is but two, 7 but seven, 8 but eight, &c. And this is the certain value of a figure; but when another figure or cypher is annexed, they then are increased in their value ten times, as 2, or 2 units or ones, to two tens or twenty; 7 to 7 tens, or seventy; 8 to 8 tens, or eighty; and thus, 23, twenty-three; 71, seventy-one; 86, eighty-six, &c. Again, if any of the said figures stand

stand in the third place towards the left hand, they then signify so many hundreds, as singly they express units or 1's, as 200 is two hundred 700 is seven hundred, 800 is eight hundred, &c. If any of them possess the fourth place towards the left hand, they are so many thousands as they contain units; and so any other figure increases by a ten-fold proportion; from the right-hand to the left, according to the place it stands at; so that 2 may be but two, or twenty, two hundred, or two thousand. In the first place 2; in the second 20; in the third 200, and in the fourth 2000, &c.

NUMERATION TABLE.

C. Thous. of M.	X. Thous. of M.	Thous. of Mill.	C. of Mill.	Tens of Mill.	Millions	C. of Thous.	Tens of Thous.	Thousands	Hundreds	Tens	Units	Thous. of Millions	Millions	Thousands	Units or Ones
12	11	10	9	8	7	6	5	4	3	2	1				
1	2	3	4	5	6	7	8	9	0	1	2	123	456	789	012
	1	2	3	4	5	6	7	8	9	0	1	12	345	678	901
		1	2	3	4	5	6	7	8	9	0		1	234	567
			1	2	3	4	5	6	7	8	9			123	456
				1	2	3	4	5	6	7	8			12	345
					1	2	3	4	5	6	7				1
						1	2	3	4	5	6				
							1	2	3	4	5				
								1	2	3	4				
									1	2	3				
										1	2				
											1				

For the easier reading of any number, first get the words at the head of the table by heart; as units, tens, hundreds, thousands, &c. and apply thus, 75, five units, five and seven tens, seventy, that is seventy-five. Again, 678; 8 units, eight, 7 tens, seventy; and six hundred, six hundred,

hundred, that is, six hundred and seventy eight. Once more, 3456; 6 units, six; 5 tens fifty; 4 hundred, four hundred; 3 thousand, three thousand; together, three thousand four hundred fifty-six. Read the fourth line of the table downwards, viz. 123456789; here the valuation of the figures is from the right-hand to the left, as 1 in the ninth is hundreds of millions, but to be read from the left hand to the right, thus, One hundred twenty-three millions, four hundred fifty-six thousand, seven hundred eighty-nine. But any number may yet be read more intelligibly, viz. by stops, thus, make a *comma* after every third figure or cypher, beginning at the right-hand, and so on towards the left, making a stop after every third figure or cypher, as aforesaid; thereby distinguishing every third place into hundreds, as hundreds of units, hundreds of thousands, hundreds of millions, and hundred thousands of millions, &c. and for trial let us read the first line of the table; the last place in valuation is hundred thousands of millions, and to be pointed into periods thus, 123, 456, 789, 012; and read thus, One hundred twenty-three thousand, four hundred fifty-six millions, seven hundred eighty nine thousand and twelve; that is, no hundreds but twelve. Again, read the following number, viz. 276,245,678,921,460; here the first point or period is betwixt 4 and 1, and the last between 2 and 6, and to be read thus; 267 millions of millions, 245 thousands of millions, 678 millions, 921 thousands, 460 units or ones. And thus may any number be read with ease, though a large one: And thus are large numbers or sums expressed, or set out in the Exchequer, Bank and Lottery Tickets, &c. as thus, Numb. 224,156,—19,478,—and 420,000, &c. The foregoing table of numeration is on the right-hand distanced out in periods, for the easier reading thereof.

It sometimes occurs in mathematical calculations, that the numbers of places of figures extend to 20, 30, 40, and even to a 100 places of figures or more: To read or numerate such long line or lines of figures, the following short rule and example will shew. Rule, begin at the right hand and count off seven places of figures to the left-hand, which is the period of millions, which mark directly over it with the figure 1, from that mark count six places more to the left-hand, over which make the mark 2, that

2, that is the period of millions of millions, or for shortness call billions; count still 6 places of figures more to the left-hand, and mark it with the figure 3, that is the period of millions of millions of millions, or shorter trillions; 6 places further, on the same way, mark with a figure 4, that is the period of quadrillions, and so on by periods of six places of figures, marking them successively with following numbers you may read quintillions, sexillions, septillions, octillions, nonillions, decillions, &c.

3
2
1  
 1 8 4 4 6 7 4 4 0 7 3 7 0 9 5 5 1 6 1 5

Thus to be read; eighteen trillions, four hundred forty-six thousand seven hundred and forty-four billions, seventy-three thousand seven hundred and nine millions, five hundred fifty-one thousand, six hundred and fifteen.

### *Of numerical Letters.*

Sometimes numbers are expressed by letters, especially in the bible, to signify the chapter or psalm; at the bottoms of title pages of books for the date of the year, and frequently in inscriptions on funeral monuments, &c. for which reason it is necessary to know how to read them, therefore observe, that I stands for 1, or an unit, II for 2, III for 3, IV for 4, V for 5, VI for 6, VII for 7, VIII for 8, IX for 9, X for 10, XI for 11, XII for 12, XIII for 13, XIV for 14, XV for 15, XVI for 16, XVII for 17, XVIII for 18, XIX for 19, XX for 20, XXI for 21, &c. XXX for 30, XXXI for 31, &c. LX for 40, XLV for 45, &c. L for 50, LI for 51, &c. LX for 60, LXI for 61, &c. LXX for 70, LXXI for 71, &c. LXXX for 80, LXXXI for 81, &c. XC for 90, XCI for 91, &c. C for 100, CC for 200, CCC for 300, CCCC for 400, D or IO for 500, DC for 600, &c. M or CIO for 1000, &c. Thus the present year 1766 is wrote, MDCCCLXVI.

### A D D I T I O N.

I S the putting two or more sums or numbers together, thereby to make one whole or total sum.

Here we must always observe to set the numbers to be added orderly one under the other, that is, units under units,

units, tens under tens, hundreds under hundreds, &c. as in the subsequent examples.

*Addition of Numbers of one Denomination.*

years.	tuns.	gallons.
29	647	6742
36	598	9846
48	423	3195
54	345	246
27	567	68
33	678	9
<hr/> 227	<hr/> 3258	<hr/> 20106

In addition of integers (or simple numbers) whether it be money, measure, weight time, or any thing else.

Remember always to carry as many ones as there are tens in the row of figures, being units, to the next row of tens, &c. and whatever it amounts to, you must insert at the bottom of each row, remembering to place units under the place of units, tens under the place of tens, &c.

Then in casting up each example, to find its total value, I begin at the right-hand, or row of units, of the first example, and say 3 and seven is 10, and 4 is 14, and 8 is 22, and 6 is 28, and 9 is 37, in which there are 3 tens and 7 over, therefore I set down 7 just under its own rank, and carry 3 to the next row, and say, 3 that I carry and 3 is 6, and 2 is 8, and 5 is 13, and 4 is 17, and 3 is 20, and 2 is 22, and it being the last row, I set down the amount, viz. 22, so that the whole number of years is found to be 227.

And the next or second example, is found by the same method to be 3258. And in the third and last example, the total number is found to be 20106. And so the total of any other example of the same kind, viz. simple numbers of one denomination may be found. *Note,* That when any of the ranks amount to just 10, 20, 30, 40, 50, &c. then you must set down the 0, under its proper rank, and carry either 1, 2, 3, 4, or 5, according to the number of tens that you find to the next row; and so you must always do, when it so happens, whether in the first, second, or third row, or in any other except the last, where what it amounts

to must be set down without any reserve or carriage in the mind, because there is no other row or rank to carry to, as was hinted before.

Addition may be proved two ways, first when you have cast up any sum as before directed, then begin at the top and cast downwards, instead of upwards; and if the figures come the same, no doubt the work is right: Besides, in things requiring care, they ought to be cast first upwards and then downwards.

The second way is chiefly for learners, being customary in most schools to teach it, which is the cutting off the top line by a stroke thus ———

For proof thereof, shall take the first question, which amounts to 227.

$$\begin{array}{r}
 29 \\
 \hline
 36 \\
 48 \\
 54 \\
 27 \\
 33 \\
 \hline
 227 \text{ Answer}
 \end{array}$$

198 Add this to the top 29

227 Proof

Having cast the sum up again, as I did at first, I now begin again the second time, only instead of going to the top of all, cast no further than the 6 (leaving out all the figures that are cut off, or stand above the line) and find it amount to 198, which I place under 227; lastly, I add this middle line 198, to the top line 29, and find they make just 227, which proves the first work to be right.

*Addition of Money.*

$$\text{At } \left\{ \begin{array}{l} \text{Farthings} \\ \text{Pence} \\ \text{Shillings} \\ \text{Pounds} \end{array} \right\} \text{ stop at } \left\{ \begin{array}{l} 4 \\ 12 \\ 20 \\ 10 \end{array} \right.$$

*Note;*

Note 1st.

$\left. \begin{array}{l} \frac{1}{4} \\ \frac{1}{2} \\ \frac{3}{4} \end{array} \right\}$  Signify  $\left\{ \begin{array}{l} \text{One farthing, or one quarter.} \\ \text{Two farthings, or two quarters.} \\ \text{Three farthings, or three quarters.} \end{array} \right.$

Note 2d, L stands for pounds, S for shillings, D for pence, or thus l. s. d. pounds. shillings, pence.

But before you proceed, get the following tables by heart.

d.	l.	s.	d.	s.	l.	s.
20 is	0	1	8	30 is	1	10
30 —	0	2	6	40 —	2	0
40 —	0	3	4	50 —	2	10
50 —	0	4	2	60 —	3	0
60 —	0	5	0	70 —	3	10
70 —	0	5	10	80 —	4	0
80 —	0	6	8	90 —	4	10
90 —	0	7	6	100 —	5	0
100 —	0	8	4	200 —	10	0
200 —	0	16	8	300 —	15	0
300 —	1	13	4	400 —	20	0

Note, Persons may improve themselves very much in reckoning up divers things, after they have by heart the tables afore said, and learned this rule of addition.

As 100 yards of tape at one penny the yard, the table tells you it comes to 8s. 4d.

An hundred yards of galloom, at one penny half-penny the yard.

In the table 100d. is ———— 8s. 4d.  
And half that sum is ———— 4s. 2d.

Answer 12s. 6d.

Now you have by heart the tables, you may cast up any sum of money without dotting, for when you know the number of pence, you may, by this table, know how many shillings to carry to the shillings place. And for the number of shillings in the row of shillings, you know that 70 shillings is 3l. 10s.

(10)	(20)	(12)
1	s	d.
17	16.	1
20	11.	7.
23	18.	9.
73	17	10
<hr/>		
136	4	3

12 set over the pence, shews that for every 12 I find in the pence row, I am to carry 1 to the shillings; for so many 20s. I find in the shillings row, 1 to the place of pounds as aforesaid.

But the easiest way of casting up this sum (for the young learner) is by using dots, as thus:

Beginning at the pence; I say 10d. and 9d. is 19d. where against the 9 I set a dot for 12d. [or you may make your dots upon waste paper] and what is more or above 12 I carry to the next figure, *viz.* 7, and it makes 14, where I set a dot also for 12, and carry the remaining 2 to the 1 on the top, makes 3, which 3d. I set between the lines, as you see in the example.

Next I look how many dots there are, and find 2, which I carry to the row of shillings, saying 2 that I carry and 17 is 19, and 18 is 37, where against the 18 I set a dot for 20s. or 11. and carry the 17s. upwards, saying 17s. I carry and 11 is 28, where I set a dot against the 11, for another 20s. and carry the remaining 8 to the 16 on the top, saying 8 I carry and 16 makes 24s. where I set down a dot for 20s. and set between the lines the remaining 4s. under the row of shillings.

*Note.* That you may sum up the shillings row without dotting; thus, saying 2s. I carry from the place of pence and 7 is 9, and 8 is 17, and 1 is 18, and 6 is 24, and 10 is 34, and 10 is 44, and 10 is 54, and 10 is 64, that is 31. 4s. then the 4s. being set between the lines, the 31. are to be carried to the pounds.

*Lastly,* The 3 dots for the 31. found in the place of shillings, I carry to the pounds, saying 3 that I carry and 3 is 6, and 3 is 9, and 7 on the top makes 16, the remaining 6 I set between the lines, under the first row of the pounds, and I carry one to the last row, saying, 1 that I carry and 7 is 8, and 2 is 10, and 2 is 12, and 1 is 13, which being set between the lines, the whole sum comes to 1361. 4s. 3d.

*Note.* That when you are to write a bill of several small parcels, begin it in order of pounds, shillings, and pence, 0 : 3 : 9, and when you are to set down 16d. set down 1s. 4d. or to set down 23s. you must set 11. 3s. 0d.

If a man owes me the three following sums of money, what come they to in the whole?

l. s. d.      *Note, That the 7d.  $\frac{1}{2}$  is seven pence*  
 202   17   7 $\frac{1}{2}$    half penny; and 1d.  $\frac{1}{4}$  is one penny far-  
 703   1   9   thing; and in the total sum between the  
 906   10   1 $\frac{1}{4}$    lines 5d.  $\frac{1}{4}$  is five pence three farthings.

---

1812   9   5 $\frac{3}{4}$

---

To cast up three sums I do thus; the  $\frac{1}{4}$  which is the farthing, and the  $\frac{1}{2}$  the half penny, make  $\frac{3}{4}$  or three farthings, which is set between the lines; next 1d. and 9d. is 10d. and 7d. is 17d. where against the 7 is set a dot for 12d. and set the odd 5d. between the lines.

Next, 1 that I carry from the place of pence, and 10s. is 11, and 1 is 12, and 17s. is 29s. I set down the remaining 9s. between the lines, and the 20s. making 49s. I carry to the place of pounds;

Saying, 1 I carry and 6 is 7, and 3 is 10, and 2 is 12, where I set a dot for 10, and set the remaining two between the lines.

Next, I carry the dot for 10, as 1, to the middle row, [being all cyphers] it is but 1 still, so I set the 1 under the row of cyphers, and proceed to the last row;

Saying 9 and 7 is 16, and 2 at the top is 18, which I set between the lines, and the whole sum comes to 1812l. 9s. 5d.  $\frac{3}{4}$

Due to	l.	s.	d.
Mr. Strongman	4	12	6
Mr. Benson	7	6	9
Mr. Coxcomb	4	12	0
Mr. Danielson	6	17	7
Mr. Eason	5	6	6
Mr. Fletcher	4	12	3
Mr. Grayhead	0	0	0
Mr. Fellows	5	15	4
	45	2	11

I begin and say 4 and 3 is 7, and 6 is 13, and 7 is 20, and 9 is 29, and 6 makes 35d. Now 30d. according to the table

table is 2s. 6d. and 5d. makes 2s. 11d. I set down 11 exactly under the rank of pence, and say 2s. that I carry (which I do to the rank of shillings) and 5 is seven, and 2 is 9 (for I only take the unit rank of shillings) and 6 is 15, and 7 makes 22, and 2 is 24, and 6 is 30, and 2 makes 32, and now being come to the top of the sum, and it making 32, I come down with the tens of shillings, saying, 32 and 10 is 42, and 10 is 52, and 10 is 62, and 10 is 72, and 10 makes 82s. and the table tells me that 80s. is 4l. I know therefore that 82s. is 4l. 2s. wherefore I set down the remaining 2s. just under the row of shillings, and carry 4, to the pounds; saying 4 that I carry and 5 is 9, and 6 is 15, and 4 is 19, and 5 is 24, and 6 is 30, and 4 is 34, and 7 is 41, and 4 makes 45l. so that the total of those several sums of money due to those several persons, amounts to 45l. 2s. 11d. as in the example.

	C. R.	26	12	6
	Y. R.	64	10	4
		496	12	10

In the second example of money received, I begin at the right hand, and say 4 and 6 is 10, and 3 is 13, and 9 makes 22, and 22d. being 1s. 10d. I set down 10, and carry 1 to the shillings; saying 1 that I carry and 2 is three, and 7 is 10, and 6 is 16, and 2 is 18, and 8 is 26, and 6 makes 32; then I come down with the tens, saying 32 and 10 makes 42, &c. and I find at the bottom it comes to 112s. which making 5l. 12s. I set down 12s. and carry 5l. to the pounds, saying, 5 that I carry and 4 is 9, &c. I find that at the top it amounts to 36, wherefore I set down 6 exactly under its own rank, *viz.* the rank of units of pounds, and carry 3 for the tens that are in 36 (for at all times in the first denomination of addition, whether of money, measure or weight; that is in the denomination of pounds, yards, or tons,

tuns, you must cast them up as sums of one denomination; that is, for every 10 carrying 1 to the next, &c.) saying 3 that 1 carry and 6 is 9, and 2 is 11, and 8 is 19, &c. and find that at the top it comes to 49; wherefore I set down 49 before the 6. and the total amounts to 4961. 12s. 10d.

*More Examples for Practice.*

10	20	12	4	10	20	12	4	10	20	12	4

<hr/>				<hr/>				<hr/>			

**ADDITION of CLOTH MEASURE.**

The table is as follows, *viz.*

- 4 nails make 1 quarter of a yard, marked n. nails.
- 3 quarters or 12 nails, 1 ell Flemish — qrs. quarters.
- 4 quarters or 16 nails, 1 yard
- 5 quarters or 20 nails, 1 ell English.

*Examples.*

10	3	4	10	4	4	10	5	4
el. fl.	qrs.	n.	yds.	qrs.	n.	el. en.	qrs.	n.
674	2	3	327	3	2	564	4	3
457	2	2	132	2	1	485	3	1
468	1	3	284	3	2	648	2	2
219	2	1	457	2	3	754	3	1
<hr/>			<hr/>			<hr/>		
1821	0	1	1203	0	0	2453	3	3
<hr/>			<hr/>			<hr/>		

In the first example, I begin at the right hand, and stop at every 4, because 4 nails make 1 quarter, and say 1 and 3 makes 4, and 2 is 6, and 3 is 9, therefore I find there are 2 fours and 1 over, which I set down under the place of nails, then I carry 2 to the place of quarters, and say 2 and 2 is 4, and 1 is 5, and 2 is 7, and 2 is 9; then I find 3 threes in 9, and nothing over, wherefore I put 0, and carry 3 to the place of integers (or ells Flemish) and say 3 and 9 is 12, and 8 is 20, and 7 is 27, and 4 is 31; then I set down 1 and carry 3 to the next row, and say 3 and 1 is 4, and 6 is ten, and 5 is 15, and 7 is 22, then I put down 2, and carry 2, and say 2 and 2 is 4, and 4 is 8, and 4 is 12, and 6 is 18, then I put down the whole 18, which makes 1821 ells Flem. 0 qrs. 1 nail; and so of the rest.

DRY MEASURE.

2 pints	make	1 quart.
2 quarts	—	1 pottle
2 pottles	—	1 gallon.
2 gallons	—	1 peck.
4 pecks	—	1 bushel.
4 bushels	—	1 coomb.
4 coombs	—	1 quarter.
4 quarters	—	1 chaldron.
5 quarters	—	1 wey.
2 weys	—	1 last.

*Note,* 5 pecks, one bushel, water measure; 36 bushels, one chaldron of coals in the pool (or river) of London.

*Examples.*

10	2	5	2	4	4	10	4	2	4	4

113	0	1	0	1	3	90	2	1	1	2
<hr/>						<hr/>				

## ADDITION of Avoirdupois Weight.

By this weight are weighed all kind of grocery goods or wares, or goods subject to waste; as tobacco, sugar, fruit and drugs; as also butter, cheese, allum, tallow, flesh, iron, brass, copper, lead, tin, or pewter, pitch, tar, rosin, hemp, flax, soap, salt, and all kind of garbled goods; that is, those goods that have dust, dross or waste.

A Table of this Weight is as follows, viz.

16 drams is 1 ounce, marked	_____	dr. drams
16 ounces 1 pound	_____	oz. ounces
28 pounds 1 quarter of a hundred weight	_____	lb. pounds
4 quarters 1 hundred weight	_____	qr. quarters
20 hundred weight 1 ton wt.	_____	C. hundreds
		T. ten.

## Small Weight.

28	16	4	28	16	28	16
C. q. lb.	C. q. lb. oz.	C. q. lb.	C. q. lb.	lb. oz. dr.		
4 1 6	24 1 12 4	9 1 0	8 10 12			
6 2 16	42 2 0 11	4 3 2	5 8 7			
5 3 24	36 1 12 12	7 1 27	6 4 9			
7 2 0	25 3 24 13	5 3 19	7 13 11			
6 0 20	19 0 20 10	4 3 26	8 15 13			
9 1 12	26 1 22 14	2 2 0	7 11 15			
39 3 22	154 3 10 0	34 3 18	45 1 3			

In the first of these examples, I begin at the right hand, to wit, at the denomination of pounds, and stop at every 28, so many pounds making a quarter, that is, at every 28 I make a dot, and I find two 28's and 22 lb. over; wherefore I set down 22, and carry 2 qrs. to the quarters, and adding them up find them 11, which is 2 C and 3 qrs. over; wherefore I set down 3, and carry 2 to the hundreds, which also added up, makes 39, so that the total weight is 39C. 3 qrs. 22 lb. &c.

Because grocers send out small parcels weekly by the carrier, they commonly write the bills of carriage thus,

	C.	q.	lb.	l.	s.	d.
A parcel down	15	3	14	1	3	7
Boxes up to London	9	1	19	0	11	11

Note

## The Young Man's best Companion. 63

*Note,* That the first line shews that the parcel that came down by the carrier, weighed 15 C. 3 qrs. 14 lb. and the carriage came to 11 3s 7d. &c.

In weighing at the water-side, or else-where, they do not weigh by the tun in great weight, tho' some goods are sold by it, as logwood, cheese, &c. but by hundreds, quarters, and pounds, which are computed afterwards by tuns, &c.

### Of Wool.

Wool is weighed by the clove, stone, tod, wey, &c. as follows:

7 pounds make 1 clove  
 2 cloves, or 14 lb. 1 stone  
 2 stone, or 28 lb. 1 tod  
 6½ tods 1 wey  
 2 weys 1 sack  
 12 sacks 1 last.

*Note,* In some places 7 tods are allowed to one wey, and 12 score or 240 lb. is called a pack of wool.

### Addition of Troy Weight.

This weight is subdivided in common thus,

24 grains is a penny-weight, marked gr.  
 20 penny weight is an ounce, ——— oz.  
 12 ounces is a pound ——— lb.

By this weight, silver, gold, liquors, amber and jewels are weighed, and till of late years, bread and flower.

### Examples of Troy Weight.

6 ingots of silver, weight, viz.					10	12	20	24
lb. oz. dwt. gr.					lb.	oz.	dwt.	gr.
Nº 1 wt.	4	5	12	10	14	6	10	21
2	5	4	16	17	24	10	11	12
3	3	11	19	20	21	6	7	10
4	4	6	7	12	22	10	12	14
5	5	1	11	12	16	11	12	13
6	4	11	12	13	21	7	6	17
<hr/>					<hr/>			
	28	6	0	12	122	5	1	15
<hr/>					<hr/>			

In the denomination of grains I stop at 24, and find it amount to 3 penny weights, and 12 grains over; wherefore I set down 12 grains, and carry 3 penny-weights to the penny weights; then I say 3 that I carry and 2 is 5, and 1 is 6, and 7 is 13, and 9 is 22, and 6 is 28, and 2 is 30; and then coming down with the tens, I say 30 and 10 is 40, and 10 is 50, &c. (just as I do in addition of money; for as there 20<sup>s</sup> make a pound, so here 20 penny-weights make an ounce) and find it come just to 80; now in 80 there are just 4 twenties, or 4 ounces; wherefore I set down 0, and carry 4 to the ounces, and find them to amount to 44, which makes 3 pounds and 6 ounces over; wherefore I set down 6, and carry 3 to the pounds; saying 3 I carry and 4 is 7, and 5 is 12, &c. and find they come to 28; so the total is 28lb. 6 oz. 0 dwt. 12 gr. and so of the rest.

#### *Apothecaries Weight and Measure.*

This is the same with troy weight, but only differently subdivided, as here under.

12	8	3	20	<i>Note, 20 grains make a scruple</i>	
lb.	3	3	9	gr.	3 scruples 1 dram
98	11	7	2	18	8 drams 1 ounce
45	10	6	1	18	12 ounces 1 pound
62	9	4	2	13	
<hr/>					
207	8	3	1	9	

This cast up as the other by dotting each row, according to the figures on the top of the sum.

*Note,* That the apothecaries sell their goods by avoirdupois weight, but compound their medicines by this troy weight, 20 grains of which make a scruple, &c. as before.

#### *Liquid Measure.*

1 pound troy weight is equal to	1 pint
2 pints	make
2 quarts	1 quart
2 potiles	1 pottle
2 potiles	1 gallon
8 gallons	1 firkin of ale, soap,
	or herring.
9 gallons	1 firkin of beer

<hr/>					<hr/>						

Thus far have been shewn the usual methods by which beginners are taught the addition of monies, weights, measure, &c. but if ever they aim at being men of business, and to be qualified to cast up large sums of monies, weights and measures with dispatch and certainty, several of the rules aforegoing, fitted for the capacity of children and youth only, must be laid aside, and more manly methods made use of. Pointing in books of accounts is intollerable, for besides betraying the inexpertness of the clerk, it defaces the books with needless marks, which no merchant or tradesman will allow, and if the points should be set upon a piece of waste paper, it is still but a childish way of doing business. The example here annexed and manner of casting of it up, if practised by a learner whilst he is perfect therein, will qualify him for performing the like in real business with ease, dispatch and exactness, in what relates to the casting up sum totals of monies, weights and measures. First, run up all the farthings which will be found to be in number 23, which is 5d.  $\frac{3}{4}$  put down  $\frac{3}{4}$ , and carry 5 to the place of pence, cast up the units place of the pence without regarding the 10 pence, which in this sum are 164, on a by slip of paper put down 4, and carry 16 to the place of tens in the pence, this 16 added to the 14 ones that stand for 10 pence each, make 30, put that 30 before 4, the odd figure left under the units place of pence, make 304 pence, which by consulting your memory or your pence table, you will find to contain 25 s. and 4d. put down 4d. under the column of pence, and carry 25 to the units place of the shillings, and with what was carried thither from the pence, will be found to be 196, put down 6 under the line of units in the shillings, and carry 19 to the place of tens of shillings, as was done before in the pence, this 19 added to the 27 ones that stand for ten shillings each, make 46, which is so many ten shillings, half pounds or angels, as they have been called; on the least consideration 46 half pounds will be found to be 23 pounds exactly, therefore put down 0 before the 6, and carry 23 to the place of p pounds; there is no occasion to say any thing here how the pounds are to be cast up, being the same as in the examples in whole numbers aforegoing.

What is principally to be observed in this way of casting up the pence and shillings, and the preference it has to  
what

what has been hitherto shewn in this book, that by casting up the units place of the pence (as in sums in whole numbers) and carrying one for every ten therein contained to the figures in the place of tens, which never can exceed 1 each, the number carried from the units place to the place of tens are as easily done as counting one two, three, &c. by which the many tedious often repeated expressions of saying, and ten is so many, and ten is so many, and ten is so many, which is tiresome to the lungs, a charge on the memory, and loss of time.

That large sums in books of accounts may be added together with the still greater ease, dispatch and certainty, the following method of noting down or registering what is carried from one denomination to another, will be found a great help to the memory and dispatch of business; the manner of registering or noting is as follows, and illustrated in this example. The sum of the place of farthings is 5d.  $\frac{3}{4}$  putting down  $\frac{3}{4}$ , I also place over it the figure 5, and it

will stand thus  $\frac{5}{4}$  the 5 at top denoting that 5 pence is carried from the farthings to the pence; the pence being cast up amount to 25 s. and 4 pence over, (as before) put

down 4 and write 25 over it, thus  $\frac{25}{4}$ , shewing that 25 is carried to the place of shillings, in like manner the units place of shillings being cast up, their sum is 196, put down

6 and write over it 19, thus 6, shewing that 19 must be carried to the place of tens in the shillings, 19 carried to the tens of shillings make 46 half pounds or 23 pounds which being carried to the place of pounds and a cypher put before the 6, the register of what was carried from the units of shillings to the tens and from the tens to the

pounds will stand thus  $\frac{23}{6}$  06, 23 carried to the units place of the pounds, and that line run up its total is 214 which is

4 and carry 21 to the place of tens, whose register is 4, properly carrying and adding up the place of tens in the

pounds the 267 which note thus 7, seven put down, and 26 carried to the place of hundreds, and the place of hundreds

hundreds cast up, the sum is 183, put down 4 in the place of hundreds, and mark 18 over it, indicating what is to be carried to the next place, that 18 carried and added to only an unite in the place of thousands makes 19 thousand in the place of thousands, the total sum with the respective registers will stand together thus

18.26.21 23.19 25.5

£. 19 4 7 4 : 0 6 : 5  $\frac{3}{4}$

This must be done on waste paper, which is as necessary to be done by the most expert accountant, whether he uses this method or not, to prevent erasements, scratches and alterations which look ill in any accounts whatsoever, for the prevention of which every method should be made use of to prevent errors creeping in. I shall say no more in recommending this method of noting or registering, I will only say that it is applicable with ease to Avoirdupoise weight or any other specie of addition, let the denominations be what they may.

SUB.

## S U B T R A C T I O N.

**S**ubtraction taketh a lesser number out of a greater, and leaveth the difference or remainder.

Always set the greatest number uppermost, and with the same care and order as in addition, set the lesser number under it, so that units stand under units, tens under tens. Whatever number you used to stop at in addition, the same must you borrow in subtraction, when need requires; remembering to carry 1 to the next place on the left hand, for that which was borrowed.

If you have 784 oxen in a field, and are to take out 334 of them to carry to a fair or market, how many will there be left in the field?

Oxen in the field	784
Ditto to be taken out,	334

Now to subtract 334 out of 784, begin on the right hand, thus :

Take 4 out of 4, rests 0, to be put under the line; next 3 out of 8 rests 5; lastly, take 3 from 7 rests 4, to be put under the line; so that there remain in the field 450 oxen, which you may prove, by adding 450 to 334, and the sum will be 784.

Oxen in the field,	784
Ditto to be taken out,	334
	<hr/>
Remains in the field	450
	<hr/>
Proof	784
	<hr/>

If a person was born in the year of our lord 1621, how many years is it since?

The present year of our lord	1766
The year of the person's birth	1621
	<hr/>

Years since 145

This you may subtract as the last question, thus, take 1 from 6 rests 5 to set between the lines, next take 2 from 6 rests 4 to set between the lines; next take 6 from 7, rests 1; so that it is 145 years since.

By this rule you may know how long it is since any thing worthy of note has happened.

Thus

*The Young Man's best Companion.* 71

Thus any distance of time, that is from any particular date of a year may be known, by subtracting that date from the present date of the year; for a further proof of which, take the following examples.

The present year	1766
The fire of <i>London</i>	1666

---

Years since	100
-------------	-----

---

The present year	1766
Gunpowder treason	1605

Years since	161
-------------	-----

---

If 643l. be owing to a merchant, and the debtor pays thereof at one time 554l. how much of the said sum of 643l. remains unpaid?

Take pen and paper, and	}	643
set the two sums thus,		

---

Remains	89
---------	----

Beginning on the right hand (as before) I say, take 4 out of 3 I cannot, therefore I borrow 10, and add it to the 3, and it makes 13; then I say, take the said 4 from the 13, rests 9, which 9 I set under the line.

Next, because I borrow 10 to add to the figure 3, yet I call that 10 but 1, saying 1 that I borrowed and 5 makes 6, take 6 from 4 above it, I cannot, therefore (as before) I borrow 10 again, and add it to the 4, makes 14, then I say, take 6 from 14, rests 8 to set under the line.

Lastly, take 1 that I borrowed at 5, and the 5 makes 6; take 6 from 6 remains 0, which being the last place towards the left hand, does not add to the number at all.

So that 554l. being paid of the sum 643l. there remains yet unpaid just 89l. as you see above.

*Example.* A person borrows of his friend 1323l. and some time after pays him in part 1146. I demand how much remains unpaid of the debt?

Borrowed	1323
Paid	1146

---

Rests due	177
-----------	-----

---

Here

Here the lesser number 1146 stands under the greater 1323; and to find the remainder, or sum resting due, I say, 6 from 3 I cannot, but 6 from 13 (for you must always borrow 10 of the next figure in the same upper line, and put it to the figure or cypher that is directly over the figure you subtract) and there remains 7; then 1 that I borrow and 4 is 5 (for as I borrowed 10 or 1 out of 2, so I must pay the said 1 or 10 to the figure again, as above hinted); I say 5 from 2 I cannot, but 5 from 12, borrowing 10 and putting it to the figure that stands immediately under it, which here is 4, as above directed) and there remains 7; then 1 that I borrowed and 1 is 2. from 3 the upper figure, and there rests 1; 1 from 1 rests 0; and so the example is done, and by it shewn that A still owes B 177 pounds, as appears in the work; and for the proof of its verity add 177 the remainder, to 1146, the lesser of the two given numbers, and it will make 1323, being the same with the greater number, or sum of money first due; and therefore a sure proof of the truth and certainty of the rule. And as subtraction is proved by addition, so may addition be proved by subtraction: For if the two aforesaid numbers, viz. 1323 and 1146, are added, their total is 2469; from which, if you deduct 1146, the remainder will be the greater number; or if you subtract 1323 from the said 2469, the remainder will be 1146, the lesser number.

All examples or sums in subtraction, of one denomination, are performed as above, without any variation.

Suppose 5643l. be owing to a merchant, whereof the debtor has paid 4754l. 12s. 8d. how much is unpaid?

*Ans.*

Note, That because the money paid is odd, that is, hath shillings and pence, besides pounds, set cyphers in the place of shillings and pence, and the sum will stand thus.

To subtract the Sum I do thus,

	10	20	12
	l.	s.	d.
Lent	5643	0	0
Paid	4754	12	0
Unpaid	888	7	4

Saying, take 8 from 0, that I cannot do, but I borrow 12 at top, and say take 8d. from 12, reits 4d. to set under the line.

Next the 12 I borrowed at the pence, I pay as 1 at the shillings, saying 1 that I borrowed, and 12s. make 13, take 13 from 0 I cannot, therefore I borrow 20, and say take 13 from 20, reits 7s.

Next, 1 that I borrow at shillings, and 4 of the pounds make 5, take 5 from 3 I cannot, therefore I borrow 10, and add to it the 3, it makes 13; then take 5 from 13, and reits 8. to be set under the line as above, finishing as the last example, and there remains unpaid 888l. 7s. 4d. For proof, add the sum paid and that unpaid together, and if it makes the sum lent, it is right, otherwise not.

If a man owed to another 1130l. 2s. 8d. and has paid of it 1036l. 12s. 9d. what remains?

Set the sum thus	10	20	12
	l.	s.	d.
Lent	1130	2	08
Paid	1036	12	09
	93	09	11

Again, be very careful in setting the figures under each other, that the cypher 0 is in the place of hundreds next the 361, the figure 1 in the place of thousands, next cypher 0, which fills up the place even with the 1000l. as the cypher by the 2s. 8d. and the 9d. above; the cypher next the left hand makes a number never the bigger, yet a cypher in the middle of any number is of service; and those next the right hand in any number in vulgar arithmetic; for the number 2030 is read two thousand and thirty, because there is a cypher in the place of hundreds, and a cypher in the

place of units or ones, which you may perceive by the following example.

The present year of our Lord is 1766

The last numer above is 2030

Now many persons will readily read those four figures 1766 the date of the year, but many will mistake in the other.

The figure 1 being one thousand, then the figure 2 under it must needs be two thousand, then the 7 over the 0 is seven hundred, next the figure 6 being sixty, the 3 under that must be thirty, &c.

Now for the true subtraction of the last example.

First, I say, take 9d. from 8d. above it, that I cannot do, therefore I borrow the 12 at top, and add it to the 8d. makes 20d, then I say take 1d. from 20d. rests 11d. which I set between the lines.

Next, because I borrowed the 12 at top at the pence place, I carry it as 1 to the place of shilling, saying 1 that I borrow, and 12s. make 13s. take 13s. from 2s. I cannot, therefore I borrow the 20 at top, and add it to the 2 makes 22, then take the 13s. from 22s. rests 9, which I set between the lines.

Next, the 20s. or 1l. that I borrowed at the shillings, I carry to the place of pounds, saying 1 that I borrowed and 6 is 7, take 7 from 0 I cannot, therefore I borrow the 10 at top, and say take 7 from 10, rests 3. to be set between the lines.

Next, 1 that I borrowed and 3 makes 4, take 4 from 1 I cannot, therefore I borrow the 10 as I did before, and say, take 4 from 13, rests 9, which 9 I set between the lines.

Lastly, 1 that I borrowed in the middle of the pounds, I carry to the 0 next the left hand, and say, 1 that I carry and 0 is 1, therefore I take that 1 from the 1 above, rests 0, to be set between the lines; and again 1 from 1 rests 0.

So that there is unpaid 93l. 9s. 11d. of the 130l. 2s. 8d. which you may prove by adding the sum paid and that unpaid together.

#### *SUBTRACTION of diverse Denominations Of Money.*

Suppose Mr. C. owes Mr. D. 9l. 2s. 6d. and Mr. C. hath paid Mr. D. in part 6l. 16s. 4d. what remains due to  
Mr.

Mr. D? Answer, due to Mr. D. 2l. 6s. 2d. as by this Example.

	l.	s.	d.	
Due	9	02	6	Take 4d. from 6d. and there re-
Paid	6	16	4	mains 2d. then 16s. from 2s. I can-
				not, but borrow one integer of the
				next denomination, or one pound,
Refts due	2	06	2	which is 20s. I say 16 from 20, and
				there refts 4, and take the over

number 2, and putting it to the remainder 4, makes 6; wherefore I put down 6 in the place of shillings, and say, 1 that I borrow and 6 is 7; now 7l. from 9l. there remains 2l. so the money resting due to Mr. D. is 2l. 6s. 2d. as in the example.

	l.	s.	d.	
8 l. for	242	16	3 $\frac{1}{4}$	Again, if Mr. Lovemoney, sells Mr. Saveall tim-
Paid in part	174	12	6 $\frac{1}{2}$	ber, to the value of 242l.
				16s. 3d. $\frac{1}{4}$ and gives Mr.
Answer	68	3	9 $\frac{1}{4}$	Lovemoney a note on Mr.
				Merly for the sum of 174l.
				12s. 6d. $\frac{1}{2}$ . I demand the

balance. Answer, 68l. 3s. 9d.  $\frac{1}{4}$ .

Here I say, 2 farthings (or a half-penny) from 3 farthings, and there remains 1 or  $\frac{1}{4}$ ; which I set down in its proper place, *viz.* under the denomination of farthings; then 6 from 3 I cannot, but 6 from 12, as marked over the denomination) and there remains 6, and 3d. over it makes 9d. which I place under the line in its right place, *viz.* of pence; then 1 that I borrowed, (that is, 1 shilling) and 12 is 13; 13s. from 16s. and there refts 3, which I likewise set down under its own rank; then 4 from 2 I cannot, but 4 from 12 (borrowing 10, as in addition I carry 1 for every 10) and there refts 8; then 1 that I borrow and 7 makes 8; 8 from 4 I cannot, but 8 from 14, and there remains 6; so that the sum remaining due is 68l. 3s. 9d.  $\frac{1}{4}$  as in the work. And for its proof, you must add the remainder, 68l. 3s. 9d.  $\frac{1}{4}$ , to the lesser or under sum 174l. 12s. and 6d.  $\frac{1}{2}$ , and it makes 242l. 16s. and 3d.  $\frac{1}{4}$ , the sum first due, which is a proof of the work's being right. See the example. Or you may subtract the sum that remains yet unpaid, *viz.* 68l. 3s. 9d.  $\frac{1}{4}$ , out of the whole sum, *viz.* 242l. 16s. 3d.  $\frac{1}{4}$  and you will find the difference or remainder will be the sum paid, *viz.* 174l. 12s. 6d.  $\frac{1}{2}$ .

Suppose

Suppose a servant was bound for 11 years, and he served 10 years, 10 months, 10 weeks, 10 days, 10 hours, 10 minutes and 10 seconds, I demand how long he has to serve. Answer, 3 weeks, 13 hours, 49 minutes, and 50 seconds, reckoning 13 months to the year.

And thus much for subtraction; which method will serve for any denomination whatever, having respect to the several tables of quantity, as before hinted in addition.

### M U L T I P L I C A T I O N .

**M**ultiplication, for its quick dispatch in business, may be accounted the most serviceable rule in arithmetic; it performeth the work of many additions in the most compendious manner, brings numbers of great denominations into small, as pounds into shillings, pence or farthings; thus into hundreds, quarters, pounds or ounces, &c. and by knowing the value of one thing, we find the value of many.

Multiplication is comprehended under three branches,

1. The multiplicand (generally the greater of the two numbers) is the number to be multiplied.
2. The multiplier (generally the lesser of the two numbers) is the number to multiply with.
3. The product, or the answer to the question. But before any thing can be done to the purpose, it is necessary to learn the following table perfect by heart.

## MULTIPLICATION TABLE.

1	2	3	4	5	6	7	8	9	10	11	12
2	+	6	8	10	12	14	16	18	20	22	24
3	-	9	12	15	18	21	24	27	30	33	36
4	-		16	20	24	28	32	36	40	44	48
5	-			25	30	35	40	45	50	55	60
6	-				36	42	48	54	60	66	72
7	-					49	56	63	70	77	84
8	-						64	72	80	88	96
9	-							81	90	99	108
10	-								100	110	120
11	-									121	132
12	-										144

To read this table of multiplication. First, begin at the top, at the figures 2 and 2, saying, twice 2 is 4, twice 3 is 6, &c. Then say 3 times 3 is 9, 3 times 4 is 12, &c. Next, 4 times 4 is 16, &c.

Multiplicand	3471	2759	5210	3479
Multiplier	4	5	6	8

*Examples with several Figures.*

Example.  
Multiply 89  
by 47

623  
356

Answer 4183

Proof.  
Multiply 47  
by 89

423  
376

The same 4183

In the example I say, 7 times 9 is 63, that is 3, and I carry 6; then 7 times 8 is 56, and 6 I carried is 62, which I set down; so is the first line or row finished: then I take the second figure of the multiplier, saying, 4 times 9 is 36, which 6 I set under the 2, or tens place of the first line, and carry 3; and then I say, 4 times 8 is 32, and 3 that I carried is 35, placing the 5 under the 6, and the 3 quite out towards the left hand. Lastly, I add these up in order, as they stand, saying, 3 is 3; then 6 and 2 is 8; again, 5 and 6 is 11, that is 1, and I carry 1 to 3 is 4.

*To prove Multiplication.*

It is a common way to prove multiplication by the cross; but it is subject to so many errors, that in short, it is no proof at all to the learner. The best way therefore is this: Take the multiplicand and set it below, and the multiplier at top, that is, change the multiplicand into the multiplier, and proceed as before directed; and if the product be the same as before, the work is entirely right. See the next examples wrought at large both ways.

Example  
Multiplicand 28  
Multiplier 24

112  
56

Product 672

Proof.  
24  
28

192  
48

672

The

The proof of this example is worthy your observation; for be the sum ever so large, if you change the multiplicand into the multiplier's place, and multiply right, you will find the product always the same.

671243	510748
12345	17432
<hr/>	<hr/>
3356215	1021496
2684972	1532244
2013729	2042992
1342486	3575236
671243	510748
<hr/>	<hr/>
3286494835	8903359136
<hr/>	<hr/>

When cyphers are intermixt with figures in the multiplier, then multiply by the figures as above; and when you come to a cypher in the multiplier, then set down another cypher exactly and perpendicularly under it; then begin the multiplicand again with the next figure to the cypher in the multiplier, and go through it in the same line, placing the first figure of that product next to the cypher towards the left hand, but then heed must be taken, that the next figure or cypher of the next line must be set down one degree farther towards the left hand, and not immediately under the last figure set down next to the cypher: As in the following examples may be fully understood.

3241	246805	46798
304	3402	3040
<hr/>	<hr/>	<hr/>
12964	493610	181020
97230	9872200	143940
<hr/>	<hr/>	<hr/>
985264	740415	142265910
<hr/>	<hr/>	<hr/>
	839630610	
	<hr/>	

When you have a cypher or cyphers in the multiplier at the beginning towards the right hand; then set it or them backwards from the place of units towards the right hand; and when you have multiplied by the figure or figures, annex the cypher or cyphers:

As in these Examples.

8754 80	8471 500	6174 3200
<hr/>	<hr/>	<hr/>
700320	4235500	1234800
<hr/>	<hr/>	<hr/>
		18522
		<hr/>
		19756800
		<hr/>

When you are to multiply by 10, 100, 1000 or 10000; it is only adding or annexing so many cyphers to the multiplicand, as are in the multiplier, that is, either 1, 2, 3, or 4 cyphers, and the work is done. *Example*, Suppose I am to multiply 2375 by the numbers above; if I multiply it by 10, then I join 0 to 2375, and then it makes, or the product is, 23750: if by 100, then I annex 00, and then it makes 237500; If by 1000, I put to it 000, and then it produces 2375000: And lastly, if by 10000, I then add 0000, and then it makes 23750000, &c. and thus may any number be multiplied, when the multiplier consists of an unit with any number of cyphers.

Suppose you want to know how many half crowns there are in 425 l. you know that 8 half crowns make a pound, wherefore set them down thus:

$$\begin{array}{r}
 1. \\
 \text{Multiply by } 425 \\
 \quad \quad 8 \text{ the half crowns in a pound} \\
 \hline
 3400 \text{ half crowns in all} \\
 \hline
 \end{array}$$

Again, in 3400 half crowns how many pence?

$$\begin{array}{r}
 \text{Multiply by } 3400 \\
 \quad \quad 30 \text{ the pence in a half crown} \\
 \hline
 \text{Answer } 102000 \text{ pence in all.} \\
 \hline
 \end{array}$$

And this serves to shew that great denominations are brought into smaller by this rule.

Suppose

# 84 *Youth's faithful Monitor: Or*

Suppose a piece of ground was 43 feet long, and 7 feet wide, I demand the contents?

Multiply 43 the length,  
by 7 the breadth,

Answer will be 301 square feet.

Suppose an hundred weight of iron to be worth 11s. what is the value of 310 cwt. thereof in shillings?

Multiply by 11

Answer 3410

Admit a servant's wages be 32 shillings a month, what comes 140 servants to for the same time?

Multiply by  $\begin{array}{r} 140 \\ 32 \end{array}$

$\begin{array}{r} 280 \\ 420 \end{array}$

Answer 4480

Suppose a piece of land be 236 poles in length, and 182 in breadth, how many square poles are therein?

*Note,* That a pole in length is 16 feet and an half, and a pole of land is a square piece of ground, 16 feet and an half each way.

Length in poles 236  
Breadth in poles 182

I begin at the figure 2 of the breadth, saying 2 times 6 is 12, setting the 2 of the 12 under the line, keeping 1 in mind. Next, 2 times 3 is 6, and the 1 kept in mind makes 7, &c. so continue till all the three figures are done with, then adding up the three rows of figures, you have the total.

Poles in all the land 42952

# *The Young Man's best Companion.* 85

If one seaman has 24s. the month's wages, what will the wages of 4217 seamen, for the same time, come to?

$$\begin{array}{r} 4217 \\ 24 \\ \hline 16868 \\ 8434 \\ \hline 101208 \text{ shillings.} \end{array}$$

The Answer is 101208 shillings, which you may reduce into pounds, by the second example in reduction.

If there is a square pitched field of soldiers, containing 148 men in rank, and 148 men in file, how many men are they?

$$\begin{array}{r} 148 \\ 148 \\ \hline 1184 \\ 592 \\ 148 \\ \hline \text{Answer } 21904 \end{array}$$

If an orchard contains 20 squares, and every square 20 trees, and every tree 30 branches, and every branch 40 apples, how many apples are there in the orchard?  
Answer, 480000, viz.

The number of squares	20
The trees in one square	20
	<hr/>
The trees in all	400
The branches in a tree	30
	<hr/>
The branches in all the trees	12000
The apples on a branch	40
	<hr/>
The apples in the whole	480000
	<hr/>

*Multiplication of Money.*

Multiplication of Money hath great affinity with addition of money; the same method being taken in carrying from one denomination to the next, *viz.* from farthings to pence, from pence to shillings, and from shillings to pounds. And as in addition (and other multiplications) you begin at the right hand, and proceed towards the left; so here you begin at the least denomination, which is also at the right hand.

This method of accounting is the most apt and expeditious of all others, for smaller quantities; and therefore extremely necessary in making bills of parcels, &c. And is, beyond all contradiction, as sure and certain as any way whatsoever.

*The general Rule is,*

Always multiply the price by the quantity.

The first step is, for quantities from 2 to 12; and this is done by one multiplier; as in the examples following.

*Example 1.* What must I give for 6 pieces of silk, if one piece cost 8l. 12s. 6d.

	l.	s.	d.
Multiply the price	8	12	6
By			6

And the product is the Answer, 51 15 0

Here I say 6 times 6 is 36 pence, which is just 3s. I set down 0 in the place of pence, and carry 3s. to the place of shillings, (exactly the same as in addition of money;) then 6 times 12 is 72, and 3 is 75s. that is 3l. 15s. wherefore I set down 15 in the place of shillings, and carry 3 to the pounds; then 6 times 8 is 48, and 3 is 51. So the whole amount of the 6 pieces of cloth, at 8l. 12s. 6d. per piece, is 51l. 15s. as in the work.

*Example 2.* What is the value of nine ells of damask, at 6s. 4d. per ell?

	l.	s.	d.
Multiply the price	0	13	4
by			9
Answer	6	0	0

In

In this exemple I say 9 times 4 is 36d. or 3s. I set down 6 and carry 3; then 9 times 3 is 27, and 3 makes 30; I set down 0, and carry 3 (as in the multiplication of simple numbers) then 9 times 1 is 9, and 3 is 12; which being the tens of shillings, consequently they are angels; which being halved, make just 6l. and so much is the value of 9 marks, or any thing else at that price, viz. 13s. 4d.

*Example 3.* What is the value of 12 pair of stockings, after the rate of 6s. 5d. per pair;

s.	d.
6	5
	12
£. 3	17 0

Here I say 12 times 5 is 60d. or 5s. I set down 0 and carry 5, then 12 times 6 is 72, and 5 is 77, which is 77 s. or 3l. 17s.

The next degree in this way of reckoning, is of quantities exceeding 12, even to 12 times 12, or 144; all which, as far as 144, are found in the table of multiplication; which is a ready help to all purposes of reckoning, and particularly in this way: and that you may proceed with celerity, you must be very perfect in the said table, that you may be immediately apprehensive what component parts hit your quantity proposed, or pretty near it; (for any quantity below 12 needs no recollection at all, as in the two examples foregoing) and then work accordingly.

When the quantity proposed is a number irregular, or such a number, that no two numbers in the table can be found to answer it, then we must multiply by two such numbers as come pretty near it, as is said above; and for the number wanting to make up the number or quantity proposed, multiply the given price by the number that is wanting, which will make three products by three multiplications; which last product must be added to the foregoing products resulting from two multiplications, and the total will be the answer.

And first, I shall shew examples of the second step, viz. of regular quantities that exceed 12, and are precisely answered at two multiplications, viz.

I 2

What

What comes 15 yards of callico to, at 3s. 5d. per yard?

s.	d.	
3	5	
	3 and 5	
<hr/>		
10	3	
	5	
<hr/>		
2	11	3
<hr/>		

Here 3 times 5 is 15d. or 1s. 3d. put down 3 and carry 1s. then 3 times 3 is 9, and 1 is 10s. to the first product is 10s. 3d. which I multiply by 5, saying, 5 times 3 is 15d. or 1s. 3d. 3 and carry 1, then 5 times 10 is 50, and 1 is 51s. or 2l. 11s. So the whole amount of 15 yards, at 3s. 5d. per yard, is 2l. 11s. 3d. And demonstrable thus, *viz.* If 10s. 3d. be the value of 3 times 3s. 5d. then 5 times the value of 10s. 3d. must of necessity be 15 times the value of 3s. 5d. because 5 times 3 is 15: And its truth may be proved by addition and multiplication, thus, set down 3s. 5d. 3 times, in additional order, and put the three lines together, and the total of them multiply by 5, as before, and the answer will be the same. Or set down 17s. 1d. (the product of 3s. 5d. multiplied by 5) 3 times also, and then add them together, and the total will be exactly the same with the result by multiplication; as in the following examples.

( 1 )	( 2 )	( 3 )
s. d.	s. d.	s. d.
3 5	3 5	17 1
3 5	5	17 1
3 5	<hr/>	17 1
<hr/>	17 1	<hr/>
10 3	<hr/>	2 11 3
5		<hr/>
<hr/>		
2 11 3		

By this we see, that in all examples under this head, we are to pitch two numbers (for multipliers) in the table; which multiplied together, make the quantity proposed; and then we are to multiply the price by one of the numbers, it matters not by which first, and then that product is to be multi-

*The Young Man's best Companion.* 89

multiplied by the other number, and the second or last product will be the answer.

*Example.* What is the value of 21 pair of pumps, at 7s. 9d. per pair?

$$\begin{array}{r}
 \text{s.} \quad \text{d.} \\
 7 \quad 9 \\
 7 \text{ and } 3 \\
 \hline
 2 \quad 14 \quad 3 \\
 \quad \quad 3 \\
 \hline
 8 \quad 2 \quad 9
 \end{array}$$

In this Example I say, 7 times 9 is 63d. or 5s. 3d. I set down 3 and carry 5; then 7 times 7 is 49, and 5 is 54s. or 2l. 14s. So the first product is 2l. 14s. 3d. which I multiply by 3, and that produces the last product or answer, viz. 8l. 2s. 9d.

*More Examples.*

What cost 36 yards of | What is the value of 44  
diapers, at 4s. 5d. per yard? | hats, at 10s. 6d. per hat?

Answer 69 6 0

The next gradation of advance is of quantities irregular, or of numbers that are not to be answered precisely at two multiplications: In this case, there arriveth no increase or difficulty, but it is as easy as the examples foregoing; only here you will have an addition of one line more, occasioned by bringing down the price of one to be added to the last product; or else a line more made by multiplying the price by what is defective or wanting in the number by two multiplications, to make up the proposed quantity compleat; as it may be of 2, 3, 4, 5, &c. as by the subsequent examples may be seen.

*Example.* What is the value of 39 silver mugs, at 2l. 13s. 6d. per mug?

l. s. d.  
2 13 6  
6 and 6

---

16 1 0  
6

---

96 6 0  
8 0 6

---

Answer, 104 6 6

Here I find that 6 multiplied by 6 makes 36, which is within 3 of the quantity proposed; wherefore I multiply by 6, and that product again by the other 6; the last product is 96l. 6s. which is the value of 36; but we want to know

# *The Young Man's best Companion.* 91

know the value of 39, wherefore I multiply the price of one, viz. 2 l. 13s. 6d. by 3 that is defective or wanting to make up 36 to 39, saying 3 times 6 is 18d. &c. and find that 3 times 2 l. 13s. 6d. is 8 l. os. 6d. which added to 36 l. 6s. the total, which is 104 l. 6s. 6d. gives the compleat value of 39; for 36 and 3 makes 39 See the work.

*Example.* What cost 79 cwt. of Sugar, at 28s. per Cwt?

$$\begin{array}{r}
 \text{s.} \\
 28 \\
 7 \text{ and } 11 \\
 \hline
 9 \quad 16 \\
 11 \\
 \hline
 107 \quad 16 \\
 2 \quad 16 \\
 \hline
 \text{Answer, } 110 \quad 12
 \end{array}$$

In this example I say 7 times 8 is 56, 6 and carry 5; and 7 times 2 is 14, and 5 is 19; the half of which is 9 and an half, or 9 lb. 10s. so the first is 9 l. 16s. which multiplied by 11, produces 107 l. 16s. or the value of 77; then for 2 wanting I multiply the price by it, and that gives 2 l. 16s. which added to 107 l. 16s. makes the whole value 110 l. 12s. as in the work.

*Example.* 112 lb. of soap, at 4d.  $\frac{3}{4}$  per lb.

$$\begin{array}{r}
 \text{d.} \\
 4 \quad \frac{3}{4} \\
 10 \text{ and } 11 \\
 \hline
 3 \quad 11 \quad \frac{1}{2} \\
 11 \\
 \hline
 2 \quad 3 \quad 6 \quad \frac{1}{2} \\
 9 \quad \frac{1}{2} \text{ the product of 2 lb.} \\
 \hline
 \text{which is wanting.}
 \end{array}$$

Answer, 2 4 4 4

*Note,*

*Note,* After I have multiplied by 10 and 11, the parts of 110, there wants 2, therefore I multiply 4d.  $\frac{1}{2}$  by 2, which gives 9d.  $\frac{1}{2}$  which added to 2l. 3s. 6d.  $\frac{1}{2}$  makes 2l. 4s. 4d. the value of 112 lb.

*Example.* 94 pair of gloves at 22d. or 1s. 10d. per pair?

s. d.  
1 10  
10 and 9

18 4  
9

8 5 0  
7 4

L 8. 12 4 Answer.

Here what is wanting, after the two multiplications, is 4s. wherefore I multiply 1s. 10d. (the price) by 4, which produces 7s. 4d. to be added, &c.

*Example.* 38 cwt. and an half of currents at 25s. 6d. per cwt?

s. d.  
25 6  
9 and 4

11 9 6  
4

45 18 0  
2 11 0

12 9 for the  
half cwt.

49 1 9 Answer.

After I have multiplied by 9 and 4, I multiply the price 25s. 6d. by the quantity wanting, and it produces 2l. 11s. then for the half cwt. I take half of the price, which is 12s. 9d. and then collect the three lines, the total of which is 49l. 1s. 9d. for the answer.

*Note,* From the last example may be observed, that there is 2 wanting to make up the true quantity; nay, if the two multiplications be short by 10 or 12, it is as easy to multiply the price by 10 or 12, as by 2 or 3, and the addition is the same.

*Example.* What comes 110  $\frac{1}{4}$  loads of hay, at 4l. 10s. 6d. per load?

l.	s.	d.
4	10	6
10 and 10

Ans<sup>w</sup>.

After I have multiplied by 10 and 10, which makes 100; I multiply the price 4l. 10s. 6d. by 10 that is wanting, which gives the same with the first product, *viz.* 45l. 5s. which stands under the product by 100; and for the  $\frac{1}{4}$  of a load, I take  $\frac{1}{4}$  of the price, *viz.* first the half, and then the half of that half, that is 2l. 5s. 3d. and 1l. 2s. 7d.  $\frac{1}{2}$ ; which 4 lines added together make 501l. 2s. 10d.  $\frac{1}{2}$  for the answer.

## D I V I S I O N.

**D**IVISION is the reverse of multiplication; for, as any sum is encreased as many times as the figure is multiplied by; so in division, the number is decreased, or divided into as many parts, as the value of the figures divided by.

There are four things very necessary to be known in division, *viz.*

First, The dividend, which is the sum given to be divided.

Secondly, The divisor, or number given to divide by.

Thirdly, The quotient or answer, which shews how many times the divisor is contained in the dividend; or into how many parts the dividend is divided.

Fourthly, The remainder, which is a fractional part of the quotient: but the three first should be well understood what they mean.

Observe: Let us take any two numbers, suppose 24 and 6: Now 24 is the dividend, and 6 the divisor. Then I ask how many times 6 can I have in 24, and the answer is 4: which 4 is called the quotient. So also, suppose it was required to divide 108 by 12, or into 12 parts, then every part would be 9, for 12 times 9 is 108. Now 108 is

is the dividend, or sum to be divided; 12 is the divisor, and 8 is the quotient.

I will now proceed to some examples in single figures; but pray observe the following rule.

*Of dividing by single Figures in one Line only.*

*Rule.* First, ask how many times the divisor is contained in the first figure of the dividend, and if the divisor be larger than the first figure of the dividend, then seek how many times it can be had in the first two figures of the dividend, and set the figure down accordingly: And if any thing remains from the first figure in the dividend, carry it to the second; and if any thing remains in the second figure, carry it to the third; remembering always in this short division, that if one remains to call it 10, if 2 remains call it 20, if 5, 50, and so on; carrying the remainder of one figure to another in mind.

*Note,* To make the work both shorter and easier, remember, that 2's is two's, 3's is read three's, 5's is five's, 12's is twelve's, and so for any other figure: Thus, the 7's in 14, is read thus, the seven's in 14; and the 6's in 24, is the sixes in 24; which is the same as if I should ask, how many sixes can I have in 24, but only shorter and more convenient.

An example or two will, with care make it familiar.

*Example 1.*

	Dividend.	
Divisor	3) 36	
	<hr/>	
Quotient	12	Answer.
	3	
	<hr/>	
Proof	36	
	<hr/>	

*Example 2.*

	Dividend.	
Divisor	4) 128	
	<hr/>	
Quotient	32	Answer.
	4	
	<hr/>	
Proof	128	
	<hr/>	

Now observe, in *Ex. 1.* I ask how many 3's I can have in 3, or I say, 3's in three once; then I set down 1 under the 3 in the dividend, and as nothing remains, I ask how many 3's in 6, or I say, the 3's in 6 are 2 times, or twice, and nothing over; therefore, I set down 2 under the 6, and it is done.

Again

Again, in Ex. 2. I say the 4's in 1 I cannot, but taking the next figure to it, viz. 2, I say, 4's in 12 is 3 times, then I set down 3 under the 2, and as nothing remains, I say the 4's in 8 is twice, then I set down 2 under the 8, and it is done. Now to prove it, I multiply 32, the quotient, by 4 the divisor, and find it 128, like the dividend.

Answer	<u>27229</u> 9
Proof	<u>245061</u>

Now observe in Ex. 3, I divide by 8, saying, the 8's in 3 I cannot, but the 8's in 37 is 4 times 8 is 32, and 5 over; I therefore set down 4 under the 7, and carry 5 to the next figure, which is 1, which I now call 51; (for what I carry from one figure, I must always place before the next figure) then I say the 8's in 51 is 6 times 8 is 48, and 3 over; which 3 I now carry to the 6, and it is 36; therefore I say the 8's in 36, is 4 times 8 is 32, and 4 over; this 4 I now place before the 8, and it is 48; then I say the 8's in 48 is 6 times, and the work is done. To prove it, I multiply the quotient or answer by the divisor 8, and find the product the same as the dividend. In Ex. 4, I say, the 9's in 2 I cannot, but the 9's in 24 are 2 times, or twice 9 is 18, and 6 over, which 2 I place under the 4, and carry 6 to the next figure, which is 5, and call it 65; then I say the 9's in 65 is 7 times 9 is 63 and 2 over, which 2 I place before the cypher (0) and it is 20; then I say the 9's in 20 is twice 2 is 18 and 2 over, which I carry to the 6, and it is 26, then I say the 9's in 26 is twice and 8 over, which I set before the last figure 1, and it is 81; then I say 9's in 81 is 9 times and nothing over.

To prove it, I multiply the answer by 9, and the product will be the same as the dividend.

5) 671849

Answer    134369 4  
                     5

Proof      671849

*To divide by Twelve the short way.*

Let it be required to divide 154974 by 12; I set it down thus:

12) 154974  
       12  
       32914-6

Here I divide by 12, saying the 12's in 15, is 1 and 3 over, this I carry to 4, and it is 34; then 12's in 34 twice and 10 over, that is 109; then the 12's in 109 is 9 times, and 1 over, that is 17; then the 12's in 17, once and 5 over, that is 54; then the 12's in 54 is 4 times and 6 over, which I place after the sum thus, -6, and it is done. Now to prove it I multiply back by 12, and take in the remainder, and proceed as in single figures.

*Note.* Multiplication is an infallible proof for division; for if you multiply the quotient by the divisor, you will have

have the same figures as are in the dividend : but always remember to take in the remainder, with the first figure you begin to multiply by.

There are three or four ways to work division ; but as my intent is not for curiosity, but improvement, I shall only shew that method which is most natural and practicable ; and you may at any time learn the rest.

*2. Of dividing by two, three or more Figures.*

*Rule.* First, seek or ask how many times the figures in the divisor are contained in the same number of figures in the dividend ; if they be less than the divisor, take in the next figure, then ask how many times, and put that figure in the quotient. Multiply then the divisor by the said figure in the quotient, and place it under those figures in the dividend that you began to work with, always observing, that the product be not larger than the figures in the dividend ; for if they are, you must rub out the figure in the quotient, and put one of a less denomination. This being done, subtract the product from that part of the dividend it stands under, and to the remainder bring down the next figure in the dividend, placing or joining it to the last figure of the remainder. Then seek how many times the divisor is contained in these figures ; then multiply the divisor by the said figure ; then subtract again ; and lastly, bring down the next figure in the dividend, as before ; and proceed thus till there are no more figures in the dividend, and the work is done.

*Note 1,* Every time you subtract, observe whether the remainder is larger then the divisor, if it is, you must put a larger figure in the quotient ; and whenever a figure is taken down and joined to the remainder, and is still less than the divisor, then put a cypher in the quotient, and bring down another figure of the dividend ; if this is still less, put another cypher in the quotient, and proceed as before.

*Note 2,* That a cypher can never be put for the first figure in the quotient, only in decimals.

An example or two at large, will make it easier.

## Example 1.

Divisor 14) 17276 (1234 Quotient or Answer.

14

32

28

47

42

56

56

1234

14

4936

1234

Product 17276 Divid.

Now observe: Having 2 figures in the divisor, I ask how many times they are contained in the two first figures of the dividend [*viz.* 17] and find it once; therefore I set 1 in the quotient, then I multiply the divisor 14 by 1, saying once 4 is 4, once 1 is 1, and place it under the 17. Then subtract 14 from 17, and there remains 3; and lastly I bring down the next figure in the dividend (*viz.* the 2) and join it by the side of the remainder 3, and it is 32; and now I begin as at the first, and ask how many times 14 are contained in 32, and find it twice; therefore I set down 2 in the quotient: Then I multiply the divisor 14 by 2, which is 28, and place it under 32; this done, I subtract 28 from 32, and there remains 4; and then again I bring down the next figure of the dividend (*viz.* 7) and place it by the side of 4, and it is 47. Then I ask how many times 14 I can have in 47, and find it 3 times; therefore I put 3 in the quotient, and multiply 14 by 3, which is 42, which I place under 47. Then I subtract 42 from 47, which is 5, and bring down the last figure in the dividend, which is 6, and it makes 56; then I seek how many times 14 I can have in 56, and find it 4 times; then I multiply 14 by 4, and find it just 56, which I place under the other 56, and the work is done.

## R U L E 2.

*Note 1,* When there are several figures in the divisor, it is easier for a learner, to ask how many times the first figure of the divisor is contained in the first figure of the dividend, and place the times in the quotient; then multiply

tiply the whole divisor by the quotient figure, and if the product be more than the figures which belong to the dividend, you must try a figure less, and put it in the quotient.

*Note 2.* If the first figure of the divisor be larger than the first figure in the dividend, then take two figures in the dividend, and seek how many times the first figure of the divisor is contained in them. But

Remember, that in making trial how often the first figure in the divisor is contained in two figures of the dividend, it will sometimes appear to be 10 or 12 times; but observe, it never can be above 9 at most, and oftentimes not so many as it appears to be.

*The same Example farther demonstrated.*

Let it be required to divide 17276 by 14.

First, I set the dividend down on a slate, and make a couple of crooked lines at the ends of it, in the first of which I place the divisor, thus, 14)17276( and the other is to place the quotient in.

Secondly, I ask how many times the first figure of the divisor is contained in the first figure of the dividend, and find it once, therefore I place a 1 in the quotient, and multiply the whole divisor by it, and place the product under the two first figures of the dividend, and subtract it therefrom, and it will stand thus :

*Second Work.*

$$\begin{array}{r} 14 \overline{) 17276} \quad (1 \\ \underline{14} \end{array}$$

3

Thirdly, to this remainder 3 I bring down the next figure, viz. 2, (always making a dot under the figure I bring down) and it is 32; then I ask how often the first figure 1 in the divisor is contained in 3, and it is 3 times; but upon trial I find 3 times 14 is 42, therefore, as 42 is more than 32, I must take a less figure; I therefore make trial of a 2, and find twice 14 is 28, which I place under 32, and subtract it, and there remains 4, which stands thus :

K 2

*Third*

*Third Work.*

$$\begin{array}{r}
 14 \overline{) 17276} \quad (12 \\
 \underline{14 \phantom{00}} \\
 32 \\
 \underline{28} \\
 \hline
 \end{array}$$

Remains 4

Fourthly, I now make a dot under the 7, and bring it down by the side of the 4, and it is 47, then I ask how many of the first figures of the divisor I can have in the two first figures of the dividend, and find it four times; therefore, I multiply 14 by 4, and it is 56: Now I cannot take 56 out of 47, therefore 4 times is too much, and I make trial of a less figure, to wit, 3, which I put in the quotient and multiply 14 by it, which is 42, and place it under 47, and there remains 5, which stands thus:

*Fourth Work.*

$$\begin{array}{r}
 14 \overline{) 17276} \quad (123 \\
 \underline{14 \phantom{00}} \\
 32 \\
 \underline{28} \\
 \hline
 47 \\
 \underline{42} \\
 \hline
 \end{array}$$

Remains 5

Lastly, I make a dot under the 6, and bring it down by the side of the 5, thus 56; then I ask how many times the first figure of the divisor is contained in 5, or the ones in 5 is 5 times; but upon trial, I find it will go but 4 times; therefore I place a 4 in the quotient, and multiplying 14 by it, find it to be 56, which I place under the other 56, and there remains 0, and the work is done, as under.

*Last*

*Last Work.*

Divisor 14) 17276 (1234 Quotient.

$$\begin{array}{r}
 14 \dots \\
 \hline
 32 \\
 28 \\
 \hline
 47 \\
 42 \\
 \hline
 56 \\
 56 \\

 41 \text{ Rem.} \\
 \hline
 13456789 \\
 \hline
 \hline
 \end{array}$$

Remains 41

This method of proving division by addition, as is shewn above, is a very easy and expeditious way; it is no more than the sum total of all the respective products of each figure in the quotient multiplied with the dividend, taking

in the remainder, if any, these respective products which are marked with stars in the work, are seperately set on the right hand of the work. Some writers on arithmetic who recommend this method of proof, direct it to be done as the figures stand in the work, but as that must be attended with difficulty, as every other figure in the casting must be omitted, I presume the best way is to set the respective products seperately as is done in this and the following Example. The first product must have as many points after it as there are remaining figures in the dividend not brought down, and the last place of figures in each respective product must be set one place more to the right hand than the foregoing product, and so on successively, let the products be ever so many, and the remainder, (if any) the last place to the right hand, must be set square with the last figure of the last product; all added together, if equal to the dividend, the work is right. If a cypher or cyphers should occur in the quotient, for the first cypher, instead of setting the product of the next figure one place more to the right hand of the last, it must be set two places more that way, as is instanced in the proof to the third example, where there is a cypher in the quotient the 4th place of figures, line the fourth in the proof, which is the last product of six in the quotient, is set two places more to the right hand than the foregoing, and if several places of cyphers should follow one another in the quotient, the product of the next figure must be set one place more to the right hand than the number of such cyphers.

 \hline
 \end{array}$$

I hope care will be taken to have no occasion to prove the work at all. Persons in business cannot go thro' these forms; if they suspect they have done wrong, they look over the work a second time, and that is a sufficient proof in general.

*Of Contractions.*

When the Divisor consists of several cyphers after a figure or figures, then cut them all off, or separate them from the figures with a dash of your pen or pencil; and also remember at the same time to cut off as many cyphers or figures in the dividend; then work the sum as if such cyphers had not been there at all, and you will have the same answer.

*Ex. 1.*  
 $1|00)6750|00$   

---

 6750 Answer

*Ex. 2.*  
 $3|000)7812|00$   

---

 2604 Ans.

*Ex. 3.*  
 $12|0)6546|0$   

---

 545-6

Here I cut off all the cyphers in the divisor, and as many cyphers in the dividend, and divide only by the single figures, and if any thing remains, I set it after it. As in  
*Ex.*

*Example 3*, there is 6 remains, which I set after the answer, thus -6.

I shall here leave a few examples for practice sake, and proceed to division of parts.

*Examples.*

Divide 987654321 by 20, 300, 4000, 50000.

By 20, the quotient is 49382716, and the remainder 1.

By 300, the quotient is 3292181, the remainder 21.

By 4000, the quotient 246913, the remainder 2321.

By 50000, the quotient 19753, the remainder 4321.

*Division of Parts.*

Division of parts, is the dividing by any two single figures in their parts, which two figures multiplied together will be equal to the divisor.

You remember in questions of multiplication, that when any number was given in the table, you found two such figures, which, when multiplied together, would make that number; so here also you do the same, only with this difference, that you here divide by them instead of multiplying. Thus, suppose I was to divide by 24, by 36, by 48, or by 72, I first divide by 3, then by 8, for 3 times 8 is 24, and the last quotient is the answer. So if I divide by 48, I divide the number first by 8, and then that quotient I divide by 6, and have the proper answer, &c.

*Example 1.*

Divide 2376 by 24. Here 4 times 6 is 24.

First by 4) 594 Quotient by 4.

Then by 6) 99 Quotient by 24.

*Example 2.*

Divide 29676 by 36. Here 6 times 6 is 36

6) 4946

6) 8242

*Example.* Divide 11232 by 48. In this example the digits or ratio's, which multiplied together, make the divisor

# *The Young Man's best Companion.* 105

vidor 48, are 6 and 8, or 8 and 6, for it matters not which of the ratio's you divide by first; for both divisions together give a true answer, and the same quotient, as may be seen by the different methods of the following work.

$$\begin{array}{r} 6 \overline{) 11232} \\ \underline{1872} \\ 234 \text{ Quotient} \end{array} \qquad \text{Or thus, } \begin{array}{r} 8 \overline{) 11232} \\ \underline{1404} \\ 234 \end{array}$$

Here, tho' the operations are diverse, yet the quotient are one and the same. Again, divide 9156 by 42.

*Example.*

$$\begin{array}{r} 6 \overline{) 9156} \\ \underline{1526} \\ 218 \text{ Quotient} \end{array}$$

Here the divisors are 7 and 6, or 6 and 7; for either of both, will give the same quotient..

And thus may above forty examples be wrought by numbers out of the multiplication table, with great dispatch and expedition, as by 14, 15, 16, 18, 21, 22, 24, 25, 28, 32, &c.

When it happens there is any remainder in the first division, or the last, or in both, to know the true remainder as if you divided by the common way, take this method, viz. multiply the first divisor by the last remainder, and take in or add the first remainder, if there be any, and the product will be the true or same remainder as if you divided by the long way.

*Example.* Divide 5840 by 15.

Here I multiply 3, the first divisor, by 1, the last remainder, and take in 2, the first remainder, and it makes 5 for the true remainder, as may be proved at leisure by the other way.

$$\begin{array}{r} 3 \overline{) 5840} \\ \underline{5196} \\ 389-1 \text{ Quotient} \\ \underline{5} \end{array}$$

The same observation and method must be taken with respect to component parts mentioned before, in division of money, as in division of single numbers.

*Example 1.*

l.	s.	d.	
Divide 24	7	6	by 5
<hr/>			
5)	4	17	6 Answer.
<hr/>			

*Example 2.*

l.	s.	d.	
Divide 79	18	6	into 24
<hr/>			
6)	13	6	5 equal parts.
<hr/>			
4)	3	6	7½ Answer.
<hr/>			

By this method of division of money (if the quantity be, as aforesaid, made by even component parts) you may, by having the price of several things, know the price or value of one thing, at the said rate, as well as by the rule of three: So doth multiplication of money answer questions in the rule of three, when the first number is an unit or one.

Ex. If 20lb. of tea cost

l.	s.	d.	
12	14	8	what cost 1 lb?

<hr/>			
4)	3	3	8
<hr/>			

5) 0 12 8  $\frac{3}{4}$  and  $\frac{1}{5}$  of a farthing. Answer.

Ex. 2. If 36 pair of shoes cost

l.	s.	
17	2	what cost 1 pair?

<hr/>		
6)	2	17
<hr/>		

6) 0 9 6 Answer.

As in multiplication of money, to have an answer you multiply the price by the quantity; so in division of money, you divide the price by the quantity, to have your answer.

And so much at present for multiplication and division; the various and excellent uses of which will be better understood in the following rules of arithmetic, particularly in the next rule called reduction.

# REDUCTION.

**R**eduction is wrought by multiplication and division.  
For any greater number or name is turned into a lesser by multiplication, by multiplying by so many of the lesser, as make one of the greater.

For if you multiply pounds in money by 20, the product is shillings: or, shillings by 12, the product is pence: or pence by 4, the product is farthings.

Any lesser number or name is turned into a greater by division, by dividing the lesser name given by so many of the said lesser name, as make one of the greater name required.

For, if you divide any number of farthings by 4, the quotient shews the pence; or pence divided by 12, shew shillings in the quotient; and shillings divided by 20, give in the quotient pounds in money.

In 678l. how many shillings, pence and farthings? | In 674 guineas, how many shillings, pence and farthings?

$$\begin{array}{r}
 678 \\
 \underline{20} \\
 13560 \text{ shillings} \\
 \underline{12} \\
 162720 \text{ pence} \\

 679392 \text{ farthings.}
 \end{array}$$

# 108 *Youth's faithful Monitor: Or*

In 650880 farthings, how many pence, shills. & pounds? In 679392 farthings how many pence, shills. & guineas.

$$\begin{array}{r} 4) 650880 \\ \hline 12) 162720 \text{ pence} \\ \hline 2|0) 1356|0 \text{ shillings} \\ \hline 678 \text{ pounds} \\ \hline \end{array}$$

$$\begin{array}{r} 4) 679392 \\ \hline 12) 169848 \\ \hline 21) 14154 (674 \text{ guineas} \\ 126 \\ \hline 155 \\ 147 \\ \hline 84 \\ 84 \\ \hline 0 \end{array}$$

*Case.* When a number of one denomination is given to be reduced into a lesser denomination.

*Rule.* Multiply the given number by so many units of the inferior denomination into which you would have the number given reduced, as are contained in an unit of the denomination which is given, and the product is the answer.

In 345 Pounds how many farthings?  
960 the farthings in a pound.

$$\begin{array}{r} 20700 \\ 3105 \\ \hline \text{Answer } 331200 \text{ farthings.} \\ \hline \end{array}$$

*Ex.* In 287 hundred weight, how many pounds?  
112 pounds in a hundred.

$$\begin{array}{r} 574 \\ 287 \\ 287 \\ \hline 32144 \text{ pounds for answer.} \\ \hline \end{array}$$

Example

*The Young Man's best Companion.* 109

**Example.** In 628 ells Flemish, how many quarters of a yard?

628 ells  
 3 quarters of a yard in an ell Flemish  

---

 1884 quarters of a yard for answer.

**Ex.** In 484 gross of tape, each gross 12 dozen, each dozen 2 pieces, and each piece 36 yards, how many yards?

484 gross  
 12 dozen in a gross  

---

 5808 dozens in 482 gross } Multiply  
 72 yards in a dozen }  

---

 418176 yards for answer.

*Case.* When it is required to reduce numbers of diverse denominations into the lowest denominations.

*Rule.* Work as in the last case; but if you have any number of the the next inferior denomination to that you are reducing, add such number to the product.

**Ex.** In 364 l. 5 s. 5 d. how many pence?

l. s. d.  
 364 5 5 Multiply and add the 5 s.  
 20 the shillings in a pound

7285 shillings in 364 l. 5 s. } Multiply and  
 12 pence in a shilling. } add the 5 d.

87425 pence in 364 l. 5 s. 5 d. for answer.

In the last example in reducing the pounds, say 0 is 0, but 5 (in the shillings) is 5, then say twice 4 is 8, then twice 6 is 12, that is two and carry 1; then twice 3 is 6, and 1 is 7; again multiply the shillings by 12, and take in the odd pence. So the work is done.

**Ex.** In 17 cwt. 3 qrs. 15 lb. how many qrs. lbs. and oz.  
 L cwt.

cwt.	qrs.	lb.
17	3	15
by 4		
<hr/>		
71	qrs.	
28		
<hr/>		
573	.

<hr/>		
2003	lb.*	
16		
<hr/>		
12018		
2003		
<hr/>		
32048	oz.	Answer.

*Note,* The following method is very useful in many cases, to reduce hundred weights into pounds, being both short and expeditious, *viz.*

\* Set down the hundreds 4 times under one another, in the following manner, *viz.* twice under one another, and the other two, each one place more towards the left-hand; then count how many lbs. are in the odd qrs. and lbs. and place them under the units and tens, and add them together, you have the Answer.

17 cwt.

17

17

17

99 lb. in 3 qrs. 15 lb.

\* 2003

*N. B.* This method is used all over British America, in reducing long hundreds to neat pounds.

*Proof.*

In 32048 ounces, how many lb. qrs. and cwts.

Divide this back again by 16, 28, and 4, and you will have 17 cwt. 3 qrs. 15 lb.

*Reduction ascending*

Is, when numbers are reduced or changed from a lesser into a greater denomination.

*Case.* When the number is given to be reduced to the next superior denomination.

*Rule.* Divide the said given number by such a number of units of the denomination given, as make a unit of the next superior denomination, and the quotient is the answer.

*Ex-*

*The Young Man's best Companion.* 111

*Example.* In 32144 lbs. how many hundreds?

112) 32144 (287 hundreds for answer.

$$\begin{array}{r}
 224 \\
 \hline
 974 \\
 896 \\
 \hline
 784 \\
 784 \\
 \hline
 0
 \end{array}$$

*Case.* When a number is to be reduced to a denomination higher than the next superior denomination.

*Rule.* Divide the given number as before, by such a number of units of the denomination given, as make a unit of the next higher denomination, and note the remainder. Then divide that quotient by so many units of that name or denomination, of which it is of, as make a unit of the next higher denomination to the said quotient, &c. noting the remainders, as in the example following.

*Ex.* In 48763 pence, how many shillings and pounds?

12) 48763

210) 40613-7

Answer 203-3-7

*Ex.* In 76498 farthings, how many pence, shillings and guineas?

$$\begin{array}{r}
 4) 76498 \\
 \hline
 12) 19124 \frac{1}{2} \\

 12) 339108 \\
 \hline
 2|0) 2825|9
 \end{array}$$

1412l. 19s. Answer.

Reduce 874 ells English into yards.

Multiply by 5, and divide by 4, thus:

874	1092-2
5	4
<hr/>	<hr/>
4) 4370 quarters.	5) 4370
<hr/>	<hr/>
1092 2	Proof 874
<hr/>	<hr/>

Answer, 1092 yds and  $\frac{1}{2}$

Bring 300 tuns of wine into gallons.

4	Or thus,
<hr/>	252 gallons 1 tun
1200	300
63	<hr/>
<hr/>	75600
3600	<hr/>
7200	
<hr/>	
75600	
<hr/>	

And

116 *Youth's faithful Monitor: Or*

And so on the contrary by division.  
lasts. qrs. bushels. pecks.

Reduce 46 3 5 2 into pecks.  
10 qrs. 1 last

363 qrs.  
8 bushels 1 qr.

2909  
4 pecks 1 bushel

11638 pecks in 36 lasts, 3 quarters, 5 bushels and  
two pecks

4)  
In 11638 pecks, how many lasts, &c.

8) 2909-2 pecks taken in

10) 36|3-5 bushels taken in

lasts 36-3 quarters taken in  
Answer, 36 lasts, 3 quarters, 5 bushels, 2 pecks.

Thus, by the two foregoing examples it is seen, that  
reduction ascending and descending mutually prove each  
other.

How many barley corns will reach from London to  
Windsof, if they are 21 miles asunder?

First set down the whole distance, viz. 21 miles,  
then multiply by 8, the furlongs in a mile 8

And the product is 168 furlongs  
Multiply this by 40, the poles in a furl. 40

And the product is 6720 poles  
Multiply this by 11 the  $\frac{1}{2}$  yards in a pole 11

And the product is 73920 half yards  
Multiply this by 18, the inches }  
in a half yard } 18

591360

591360  
72920

And the product 1320560 inches  
Multiply this by 3, the barley }  
corns in an inch ——— } 3  
And the product is 3961680 barley corns

in 21 miles ; the distance from London to Windfor.

Suppose it was asked, how many barley corns in length will reach from London to York, which is commonly accounted to be 150 miles.

First set down 150 miles, and multiply as in the last question, and you will find the last product to be 28 millions, 512 thousand barley corns.

*Note,* An English mile is 8 furlongs, (as above)  
A Scottish and Irish mile, about a mile and an half English.

A Dutch and Polish Mile, three English miles and an half.

A French, Italian, and Turkish league, near 2 miles and three quarters English miles.

A German mile better than 4 English miles.

The Russian mile about 3 quarters of an English mile.

The Arabian mile, an English mile and a quarter.

The Hungarian mile, is 5 miles English.

The Mogul's mile, a mile and a half English.

*Land Measure.*

In 14 acres, how many roods and perches ?

14 acres

4 or multiply 14 by 160, the perches  
— in an acre, gives 2240 perches.

56  
40 perches 1 rood 40  
Perches 2240

*Proof*

*Proof.*

In 2240 perches, how many acres?

Divide by 40, and then by 4, or divide 2240 by 160, and it gives 14 acres.

## SQUARE-MEASURE.

In 28 square yards, 6 feet, how many square feet, inches and square quarters?

*Square Yards Feet.*

	28 6	
9 square feet 1 yard, by	9	
	<hr/>	
	258 square feet	
144 inches 1 foot	144	
	<hr/>	
	1032	
	1032	
	258	
	<hr/>	
	37152 square inches	
16 square qrs. 1 inch.	16	
	<hr/>	
	222912	
	37152	
	<hr/>	
	594432 square quarters	
	<hr/>	

*Proof.*

In 594432 square quarters, how many square inches, feet and square yards?

Divide this number back by 16, you have square inches; then by 144, you have square feet; and lastly by 9, you will have 28 yards, 6 feet.

*Note,* That 12 times 144, or 1728 solid inches, make a solid foot, so that you are to multiply solid feet by 1728, to bring them into solid inches, and on the contrary, to bring solid inches into solid feet, you must divide by 1728.

*Time.*

How many days, hours, minutes and seconds are expired since the birth of our Lord and Saviour Jesus Christ, supposing it 1761 Years, 217 days, and 7 hours; allowing just 365 days to a Year.

	years	days	hours
	1761	217	7
Days in a year by	365	take in 217, saying 5	
	<hr/> 8812	times 1 is 5, and 7 is	
	10567	12, &c. in the next 2 fi-	
	5285	gures.	

by 642982 days  
24 and take in 7 hours

---

2571935  
1285964

by 15431575 hours  
60

---

925894500 minutes  
60

---

55553670000 seconds or moments

*Proof.*

In 55553670000 seconds, how many minutes, hours, days and years?

Divide this by 60, 60, 24, and 365, and you will find 1761 years, 217 days and 7 hours.

*Note.* According to the table in time, 365 days 6 hours make a year; therefore as many years as are given, multiply them by 6, and add them to the hours.

If a lad be just twelve years old, how many minutes are since expired?

$  \begin{array}{r}  12 \text{ years} \\  * 365 \\  \hline  4380 \text{ days.} \\  24 \\  \hline  17520 \\  8760 \\  \hline  105120 \text{ hours.} \\  \text{add } 72 \text{ odd hours} \\  \hline  105192 \\  60 \\  \hline  6311520 \text{ minutes.}  \end{array}  $	$  \begin{array}{r}  12 \text{ years} \\  6 \\  \hline  72 \text{ odd hours in } 12 \text{ yrs.}  \end{array}  $
--	--

\* *Note.* Though I set 365 under 12, yet I multiply 365 by 12, because it is done in one line.

### The RULE of THREE DIRECT.

**I**T is so called from its nature; because there are always three numbers given to find a fourth, which fourth number must bear such proportion to the second, as the first number does to the third.

Reduce the first and third numbers into one name, and the second numbers into the least or lowest name menti<sup>d</sup> and; then multiply the second and third numbers together, and divide their product by the first number, the quotient is the answer of the question, being of the same name as the second number was brought into.

*Note,* The extreame that asketh the question, must stand in the third place, the other in the first, and the mean number in the middle between them.

All questions in this rule of three, consist of three numbers, whereof two, viz. the first and third, are always of one kind or denomination. As in this example.

If I give 20s. for 5 yards, what shall I give for 15 yards?

Now two of these are of the same kind, that is, the number of 5 and 15, which are both yards, which place thus. The number concerning which the question is asked, must be in the third place.

Now

+ ~~20s~~ - 20s

Now in this question the 15 yards is the number, and the price of which the question requires, the value; place it therefore in the third place.

Then seek out the other number of the same kind or denomination, which must be yards also, which in this question is 5; set this in the first place, and then the other number (that is 20s.) will consequently claim the second place, and the Answer to the question will be always of the same denomination with it, which here is 60 shillings.

Now the question stated, according to the foregoing rule, stands thus,

If 5 yards cost 20s. what will 15 yards cost?

$$\begin{array}{r} 15 \\ \hline 5) 300 \text{ (60)} \\ \hline 00 \end{array}$$

Multiply the second number by the third, and divide the product by the first.

*Note,* That the three numbers are 5, 20 and 15.

*Proof of the last Question.*

What shall I pay for 5 yards, when 15 yards are sold for 60 shillings.

If 15 yards cost 60s. what will 5 yards cost?

$$\begin{array}{r} 5 \\ \hline 15) 300 \text{ (20s.)} \\ \hline 30 \\ \hline 0 \end{array}$$

What is the Interest of 85 pounds at the rate of 8 pounds per cent. per annum.

The number will be stated thus:

£. P.	£. I.	£. P.
100	8	85

In this example there are two numbers that are principal money, and one that is interest; therefore the interest (according to the rule) must stand in the middle, or second place; the principal on which the interest dependeth, viz. 100 (8l. being the interest thereof) must stand in the first place towards the left hand, and the other principal on which

M

which

122 *Youtb's faithful Monitor: Or*

which the fourth number (which is the number sought for) dependeth, must possess the first place towards the right-hand.

By these rules foregoing, you may with ease and certainty perform any operation in direct proportion: and for your further information take the examples following.

*Example.* If the interest of 100l. for one year be 8l. what is the interest of 85l. for the same time?

£. P.	£. I.	£. P.
100	8	85
	20	160
	160	5100
		85
		100) 13600
		20) 136

Answer 6l. 16s.

If 32 rundlets of brandy cost 96l. what will 4 rundlets cost at that rate?

 \end{array}$$

Answer 15 l. 6 s. 8 d.

M 3

Ex.

126 *Youth's faithful Monitor: Or*

*Example.* If 9285 lb. cost 619l. 10s. what will 1 lb. cost at that rate?

$$\begin{array}{rccccccc} \text{lb.} & & \text{l.} & \text{s.} & & \text{lb.} & \\ 9285 & \text{---} & 619 & 10 & \text{---} & 1 & \\ & & 20 & & & & \end{array}$$

$$\begin{array}{r} 9285 \overline{) 12390} \text{ (1s.} \\ \underline{9285} \end{array}$$

3105s. remain  
12 d. multiply

$$\begin{array}{r} 9285 \overline{) 37260} \text{ (4 d.} \\ \underline{37140} \end{array}$$

120d. remain  
4 farthings mult.

480 farthings remaining to be divided  
by 9285, the answer will then be  
1s. 4d. 0q.  $\frac{480}{9285}$  the lb.

If one bushel of rye cost 4s. 2d. what will 2 lafts or 20 quarters cost after that rate?

First reduce the 4s. 2d. into pence, that is 50d. and the 20 quarters into bushels, that is 160, and set the question thus.

If 1 bushel cost 50d, what will 160 bushels cost?

$$\begin{array}{r} 160 \\ \text{---} \\ 3000 \\ 50 \\ \text{---} \\ 8000 \end{array}$$

The first number (or place being 1) will neither multiply or divide, then bring the 8000 into shillings by dividing by 12, as follows.

$$\begin{array}{r} 12 \overline{) 8000} \\ \text{---} \\ 2 \overline{) 0} \text{ 66 } \overline{) 68} \\ \text{---} \\ 33 \text{ - } 6 \text{ - } 8 \end{array}$$

For

For the proof of this, and the like questions, reduce the answer into pence to know whether your work be right, as appears in the work.

8000 Proof		

If a chaldron of coals (that is 36 bushels) cost 21s. what will one bushel cost?

Reduce the 21s. into pence, by reduction, which makes 252d. which divide by 36 thus,

$$\begin{array}{r} 36 \overline{) 252} \text{ (7d.} \\ \underline{252} \\ 0 \end{array}$$

so that at 21s. a chaldron, a bushel will cost 7d.

If I paid 432l. for 525 quarters of malt, what is the price of 1 quarter after that rate?

Which being stated, stands thus:

If 525 quarter cost 432l. what will 1 quarter cost?

In this question you cannot multiply the second number by the third, because the third number or place is but one.

Therefore to perform this question with ease, reduce 432l. into farthings by reduction, which makes 414720 farthings to be divided, which divide by 525, the quarters of malt; and the quotient, the answer 789 farthings; the remainder after the division is ended, are but the parts of a farthing.

Lastly, the 789 farthings being reduced, are 16s. 5d.  $\frac{1}{4}$  therefore, if 525 quarters of malt (or tods of wool or goods) be sold for 432l. one quarter will cost 16s. 5d.  $\frac{1}{4}$  after that rate. Or which is better, reduce the 432l. into shillings, and it gives 8640, which divide by 525, and the quotient is 16, and the remainder 240, which multiply by 12, the product is 2880, which divide by 525, and the quotient is 5 pence, and the remainder 255; that multiplied by 4, and the product 1020 divided as before, gives one farthing and  $\frac{1}{4}$  parts of another farthing.

If a druggist bought 5 C.  $\frac{3}{4}$  weight of drugs, which cost him 136l. 13s. 8d. how may he sell 1lb. weight without gain or loss?

Reduce the Money into pence, it makes 39284d. for the dividend, and 5 C.  $\frac{3}{4}$  weight into pound weight, by reduction, makes 644 pounds weight for the divisor; then divide the 39284 by 644, and the quotient gives 61 pence, the price of one pound, viz. 5s. 1d.

*Note,* That what sum of Money you desire to gain, add it to the price, and work as above, to know what the price of one pound will be, so will you know what you get by every single pound.

Suppose the yearly rent of 20l. belonged to 7 landlords.

Reduce the 20l. into farthings, and they are 19200, which divide by 7, the quotient gives 2742 farthings  $\frac{2}{3}$  for each landlord, from which you may subtract the taxes.

By the same Rule you may draw a composition of debts.

If one pound of Iron cost 3 pence halfpenny, what will 7 C. 3 qrs. 17lb. cost?

4

31 quarters of hundreds

28 pounds in a  $\frac{1}{4}$  of an hundred.

— Take in 17lb.

255

63

Pounds 885 in 7 C. 3 qrs. 17 lb.

3540

885

4) 12390

12) 3097 —  $\frac{1}{2}$

2|0) 25|8 — 1

Answer 12 18 1  $\frac{1}{2}$

Note, That this example may serve for a Rule to reduce hundreds, quarters and pounds into pounds: but most tradesmen set the weights in short, thus 7—3—17, instead of setting them as above 7C. 3qrs. 17lb.

Besides, this way of proof; of reducing the total to farthings again, is most necessary for young learners, in most of the questions in the rule of three.

*The single Rule of indirect Proportion.*

Whereas in the former Rule of direct proportion, the fourth number was always proportionably greater or lesser than the third, as the second was greater or lesser than the first; but in this kind of proportion, 'tis just the contrary, for the greater the third number is, the less is the fourth, and the less the third is, the greater is the fourth; for which reason 'tis called indirect or reverse proportion.

The method of stating any question in this proportion, is the same with the direct proportion; but to find the number required this is the

*Rule.*] Multiply the first and second numbers towards the left-hand together, and divide the product by the third, and the quotient arising is the answer.

*A Rule to know whether a Question proposed is to be answered by the Rule of Proportion, direct or indirect.*

Having stated the three numbers given, as was formerly directed, calling the middle number the mean, and the two outermost numbers the extremes, consider from the nature of the question, whether the third number requires more or less than the second number; if it requires more, the lesser extremum is to be your divisor; but if the third requires less, the greater extremum is your divisor. Now, so often as this lesser, and the greater extremum happeneth to be the third number, or that next the right-hand, so often is your proportion indirect; but when they are the first number, the proportion is direct: An example or two will make it plain.

*Ex.* If a board be 8 inches broad, how much in length will make a square foot?

Say, if 12 inches broad require 12 in length to make a square foot, what length will 8 inches broad require? It

will require more length, because there is less breadth.  
See the work.

$$\begin{array}{r}
 \text{In. br.} \quad \text{long} \quad \text{In. br.} \\
 12 \quad \text{---} \quad 12 \quad \text{---} \quad 8 \\
 \quad \quad \quad 12 \\
 \quad \quad \quad \text{---} \\
 \quad \quad 8) 144
 \end{array}$$

Answer 18 inches in length

*Example.* If when the price of a bushel of wheat is 6s. 6d. the penny loaf weigheth 9 ounces, what must the penny loaf weigh when the price of a bushel of the same wheat is 4s. 6d? The question is thus stated.

$$\begin{array}{r}
 \text{s.} \quad \text{d.} \quad \text{oz.} \quad \text{s.} \quad \text{d.} \\
 6 \quad 3 \quad \text{---} \quad 9 \quad \text{---} \quad 4 \quad 6 \\
 12 \quad \quad \quad 12 \\
 \text{---} \quad \quad \quad \text{---} \\
 75 \text{ pence} \quad \quad \quad 54 \text{ pence your divisor} \\
 9 \quad \quad \quad \text{---}
 \end{array}$$

$$\begin{array}{r}
 54) 675 \text{ (12 ounces)} \\
 \underline{648}
 \end{array}$$

27 ounces remain } Multiply  
20 penny weights }

$$\begin{array}{r}
 54) 540 \text{ (10 penny weights)} \\
 \text{---}
 \end{array}$$

$$\begin{array}{r}
 0 \quad \quad \quad \text{lb. oz. pw.} \\
 \text{Answer} \quad 1 \quad 00 \quad 10
 \end{array}$$

*The double Rule of direct Proportion.*

In this kind of proportion there are five numbers given to find a sixth, which sixth number will be of the same name as the third number was reduced into.

*The Rule for stating the five Numbers given is;*

Make that the third number from the left-hand, which is of the same denomination with the number sought; then place the two numbers in the first and second place to the left-hand, which are conjunctive in the Sense of the question

tion to the third, and the other two numbers in such order, that the fourth may be of the same denomination with the first, and the fifth of the same with the second; which done,

*Rule.*] Divide the product of the three next the right-hand, multiplied one into another, by the product of the two next the left-hand, and the quotient is the sixth number sought for.

*Ex.* If 100l. in 12 months gain 6l. what will 500l. gain in 8 Months?

	L. P.	Months	L. I.	L. P.	Months.
	100	12	6	500	8
	12			6	
	<hr/>			<hr/>	
Divis.	1200			3000	
	<hr/>			8	
				<hr/>	
				12 00)	240 00(20l answer
					24
				<hr/>	
				00	Remains
				<hr/>	

By the work you may perceive that 500l. will gain 20l. in 8 months at the rate of 100l. principal gaining 6l. interest in 12 months.

This question, or any other of this nature, may be resolved at two single rules of proportion, thus: If 100l. require 6l. what will 500l. require? The answer is 30l.

Then say, If 12 months require 30l. what will 8 months require? The answer (as before) is 20l.

### *The Double Rule of Indirect Proportion.*

#### *The Rule for stating your Question.*

Place the three first numbers towards the left-hand in the same order you did in the last Rule: And for the other two, place that the fourth, which is of the same denomination with your second number, and consequently the other next the right-hand: So will your first and last, viz: that required, be of one denomination, your second and fourth of another, and your third and fifth of another, And,

*The*

*The Rule for performing the Operation is,*

Divide the product of the first, multiplied into the second; and that product into the fifth, by the product made of the third and fourth, and the quotient is the answer.

*Ex.* What principal will raise 20l. in 8 months, at 6 per cent. per annum?

L. P.	Months	L. I.	Months	L. I.
100	— 12	6	— 8	— 20
12		8		
<hr/>		<hr/>		
1200		48 your divisor		
20		<hr/>		
<hr/>				
L. In.				
48) 24000 (500 quotient for answer; which proves the				
last operation.				
0 Remains				
<hr/>				

*The Proof of the Rules of Proportion.*

Every kind of proportion I have discoursed of, may have the operations proved two ways.

*Single Direct Proportion.*

When four numbers are direct in proportion, the product made of the first and fourth, is equal to that of the second and third; otherwise the work is not rightly performed.

2dly, The second way is thus: As the fourth number is to the third, so is the second to the first; otherwise the work is not right.

*Single Indirect Proportion.*

When four numbers are in an indirect proportion, the product of the first and second, is equal to that of the third and fourth; otherwise there is an error in the work.

2dly, Thus: As the first is to the third, so is the fourth number to the second, in an indirect proportion, otherwise the operation is not rightly performed.

*Double Direct Proportion.*

When a sixth number is found in a direct proportion, the product of the first, second, and sixth, is equal to that of the third, fourth and fifth numbers; if the work is not erroneous. 2dly,

2dly, Thus : As the product of the fourth and fifth numbers is to the sixth, so is the product of the first and second to the third, in a double direct proportion.

*Double Indirect Proportion.*

When five numbers are given, and a sixth found in an indirect or reverse proportion, the product of the first, second and fifth, is equal to that of the third, fourth and sixth numbers, if the work is performed right.

2dly, Thus : As the fifth number is to the product of the third and fourth, so is the sixth to the product made of the first and second, by one single direct proportion.

*The Order of deducting TARE and TRET.*

**G**ross, is the weight of a commodity, with the hoghead, chest, box, or whatever else contains it.

Tare, is the allowance given for the weight of the cask, hoghead, &c.

Tret, is an allowance of 4 pounds in 104 pounds, for waste and dust on some sort of goods.

	C.	qr.	lb.	
Ex. 11 hds. qt.	45	3	15	gross, tare 14 lb. per 112 lb.
14 $\frac{1}{8}$				how many lb. neat?
	5	2	26	tare.
Answer	40	0	17	

1. Here 14 pounds tare being  $\frac{1}{8}$  of 112 pounds, take  $\frac{1}{8}$  of the gross, the quotient gives the whole tare, which subtract from the gross, gives the neat weight.

The operation is performed thus : Divide the gross by 8, say 8 in 45, 5 times, and 5 C. remains, which is 20 qrs, and three is 23; then 8 in 23, 2 times, 7 qrs. remain, which turned into pounds by 28, and added to the 15 lbs. make 211 lbs. then 8 in 211 is 26 times. So the tare is 5 C. 2 qrs. 26 pounds.

	C.	qr.	lb.		s.	d.
Ex.	40	0	17	Neat at 22	6	
	22			lb.		
	80			14 $\frac{1}{8}$	2-9- $\frac{1}{4}$	
	80			2 $\frac{1}{7}$	0-4- $\frac{3}{4}$	
	20			1 $\frac{1}{2}$	0-2- $\frac{1}{4}$	
	3-4 $\frac{3}{4}$			facit	3-4- $\frac{3}{4}$	
	90   3-4 $\frac{3}{4}$			price of 17lb.		
	45-3- $\frac{1}{4}$					

If the tare be 16 pounds in 112 pounds, take  $\frac{1}{7}$  of the gross, and work as before.

If 18 pounds per 112 pounds, for tare, take the aliquot parts, viz.

For 16lb. take the  $\frac{1}{7}$  } Add the tare of 16, and the tare  
 For 2 take the  $\frac{1}{8}$  } of two together, the total subtract  
 from the gross, and work as before.

lb. lb. } lb.  
 If 20 in 112 for tare } for 16 take  $\frac{1}{7}$  lb.  
 } for 4 take  $\frac{1}{4}$  of 16

2. When an allowance is made for tret, then (after the tare is subtracted from the gross) the remainder is called futtle, which divide by 26 (because 4 pounds is the 26th part of 104, the allowance always given for tret) the quotient gives the tret, which subtracted from the futtle, gives the neat weight.

C. qr. lb. lb. lb. lb.  
 Ex. 45 3 15 gr. tare 16 in 112 tret 4 in 104  
 16  $\frac{1}{7}$  6 2 06 tare

l. 105 - 18 - 0 facit

234

11

3. If the allowance for tare be 8 pounds, 10 pounds, 12 pounds, in 112, or any other lesser number, whether an aliquot part of 112 or not, in such cases divide the gross into two parts by 2, which will make it half hundreds, then say 8 is  $\frac{1}{7}$  of  $\frac{1}{2}$  C. or of 12 pounds in 112 pounds.

*Rule.* From  $\frac{1}{8}$  of the gross, take  $\frac{1}{7}$  of that 8th for tare at 12 per cent. When you have found tare, subtract it always out of the whole gross.

I might enumerate examples, but these being sufficient to instruct any ordinary capacity in tare and tret, I shall proceed next to the rule of practice.

## RULES of PRACTICE.

### The even Parts.

Of a pound	Of a shill.	Of a hund.
s. d. l.	d. — s.	lb. — s.
10—0 is $\frac{1}{2}$	6 — $\frac{1}{2}$	56 — $\frac{1}{2}$
6—8 — $\frac{1}{4}$	4 — $\frac{1}{4}$	28 — $\frac{1}{4}$
5—0 — $\frac{1}{5}$	3 — $\frac{1}{5}$	14 — $\frac{1}{5}$
4—0 — $\frac{1}{4}$	2 — $\frac{1}{4}$	16 — $\frac{1}{4}$
3—4 — $\frac{1}{6}$	1 $\frac{1}{2}$ — $\frac{1}{6}$	8 — $\frac{1}{6}$
2—6 — $\frac{1}{3}$	1 — $\frac{1}{3}$	7 — $\frac{1}{3}$
2—0 — $\frac{1}{5}$		
1—8 — $\frac{1}{8}$		

1. When the given price is pence, take your parts in shillings, the product divided by 20 gives the answer in pounds.

N 2

Or

Or, you may bring it into pounds at once, by cutting off the last figure, and by considering that 240 pence is one pound, whereof 8d. is  $\frac{1}{3}$ , 6d. is  $\frac{1}{4}$ , 4d. is  $\frac{1}{6}$ , 3d. is  $\frac{1}{8}$ , 2d. is  $\frac{1}{12}$ .

## Examples.

d.		254lb. of tobacco at 1d.	d.		716 ells at 3d
	$\frac{1}{12}$	21 2d.		3	$\frac{1}{40}$ 8-19
	20	1—1—2 facit			215 at 4d.
		254lb. at 2d.		4	$\frac{1}{20}$ 3 1 1 8
	$\frac{1}{6}$	4 2—4		6	$\frac{1}{40}$ 643 8 6
	20	2—2—4 facit			16-1-6

Here you may see that 254 pounds of tobacco, at 1d. a pound, divided by the  $\frac{1}{12}$ , gives 21s. 2d. and that divided by 20 (by cutting off the last figure, and taking  $\frac{1}{2}$  of it) gives 11. 1s. 2d. the price of 254 pounds of tobacco; and for 2d. the pound take the  $\frac{1}{6}$ , because 2d. is the  $\frac{1}{6}$  part of a shilling, and for 3d. a pound take  $\frac{1}{4}$ , and so for the others at 4d. and 6d.

2. When the given price is such pence as are no even parts of a shilling, take first the greatest even parts of a shilling, and then part of that part: Add them together, and divide the product by 20, or cut off the last figure, and take  $\frac{1}{2}$ .

d.		2121 ells at 5d.	748lb. at 7d.
4	$\frac{1}{4}$	707s.	6d. is $\frac{1}{2}$ or 374
1	$\frac{1}{4}$	176—9	of which 1d. or $\frac{1}{8}$ is 62-4
		883—9	436
		44—3—9 facit	I. 21—16—4

254 lb.

254lb. of tobacco at 9d. and 10d.  $\frac{1}{2}$  a lb.

d.			d.	254 at 10d. $\frac{1}{2}$ d.
6	$\frac{1}{2}$	127	6 $\frac{1}{2}$	127 shills. in 254 6d.
3	$\frac{1}{4}$	63—6	4 $\frac{1}{4}$	84—8 in 254 groats
—			1 $\frac{1}{8}$	10—7 in 254 half p.
9	$\frac{1}{2}$	19 0—6	4 $\frac{1}{2}$	5—3 $\frac{1}{2}$ in 254 farth.
20		9—10—6 facit.		22 7—6 $\frac{1}{2}$
				11—7—6 $\frac{1}{2}$ facit

Demonstration. In 254 pounds of tobacco at 10  $\frac{1}{2}$ d per pound, there must be 254 sixpences, which is 127 shillings, and 254 groats, which is 84s. and 8d. and 254 half pence, which is 10s. 7d. and 254 farthings which is 5s. 5d. all these added together, make 227s. 6d.  $\frac{1}{2}$ , which divided by 20, gives the answer 11l. 7s. 6d.  $\frac{1}{2}$ .

d.		614lb. at 11d.			563lb. at 11d. $\frac{1}{2}$
6	$\frac{1}{2}$	307	6	$\frac{1}{2}$	281—6d.
4	$\frac{1}{4}$	204—8d.	4	$\frac{1}{4}$	187—8
1	$\frac{1}{4}$	51—2	1 $\frac{1}{2}$	$\frac{1}{8}$	70—4 $\frac{1}{2}$
—					
11		56 2—10			53 9—6 $\frac{1}{2}$
20		28—2—10 fa.			26—19—6 $\frac{1}{2}$ fac.

If the given price be any number of pence above 1s. and less than 2s. take the aliquot parts in pence (as in the last precedent) to which add the given quantity for the 1s. and proceed as before.

Examples.

d.		254lb. at 15d.	d.	254lb. at 17d.
3	$\frac{1}{4}$	63—6	1 $\frac{3}{4}$	84—8

		<hr/>	$\frac{1}{6}$	24—7
		39 6		<hr/>
		<hr/>		46 7—1
20		19—16—0 facit	20	<hr/>
				23—7—1 facit

d.		672 lb. at 22 $\frac{3}{4}$ d.		456 ells at 25 $\frac{1}{4}$ d.
6	$\frac{1}{2}$	336	$\frac{1}{2}$	228
4	$\frac{1}{4}$	224	$\frac{1}{4}$	152
4	$\frac{1}{8}$	42	$\frac{1}{4}$	38
		<hr/>	$\frac{1}{5}$	9—6
		127 4		<hr/>
		<hr/>		88 3—6
20		63—14—0 fa	20	<hr/>
				44—3—6 facit

In 672 lb. at 22d.  $\frac{1}{4}$  a lb. I take  $\frac{1}{2}$  for the 6d. the  $\frac{1}{4}$  for 1d. and the  $\frac{1}{8}$  for the  $\frac{3}{4}$ , because  $\frac{1}{4}$  is the  $\frac{1}{8}$  of 6d. by which you will find that in 672 sixpences, there are 336 shillings, and in 672 groats there are 224 shillings, and in 672 three farthings, there are 42 shilling.

4. If the given price be such shillings as are an even part of a pound sterling, take such part a of the given quantity, and the quotient is pounds.

s. d.		Ells s d.		Yards
		433 at 1—8		271 at 2s.
		<hr/>		<hr/>
1 8	$\frac{1}{2}$	36—1—8 facit	$\frac{1}{2}$	27—2—0 facit
		<hr/>		<hr/>
		674 at 2s. 6d.		495 at 3s. 4d.
		<hr/>		<hr/>
	$\frac{1}{8}$	84—5—0 fac.	$\frac{1}{6}$	82—10—0 facit

In this first example of 433 ells, at 1s. 8d. I take the  $\frac{1}{2}$  because 1s. 8d. is the  $\frac{1}{2}$  of 1l. and say 12 in 43 is 3 times, rest 7, which makes the 3 to be 73, then 12 in 73 is 6 times, rest 1, which is 1s. 8d. which I put down as above.

5. If the given price be such shillings and pence as are no even parts of a pound, multiply the given quantity by the number of shillings, and take the aliquot parts of pence, and proceed according to the second rule.

<hr/>		
	40 18	1 $\frac{1}{2}$

In the example of 63 cwt.  $\frac{3}{4}$  at 12s. 10d. the cwt. I multiply the cwt. by 12. and take the parts in pence for the odd pence; then for the  $\frac{3}{4}$  of a cwt. I first take the  $\frac{1}{2}$  of the price of a cwt. and that makes 6s. 5d. the price of  $\frac{1}{2}$  a cwt. and then I take the half of that, which gives 3s. 2d.  $\frac{1}{2}$  the price of  $\frac{1}{4}$  of a cwt. Add them together, it gives the price of  $\frac{3}{4}$  of a cwt. which is 9s. 7d.  $\frac{1}{2}$ , and must be added to your first work. Two or three examples more will make it familiar and easy to any capacity.

There are other rules, such as barter, exchange, profit and loss, &c. but all of them being done either by the rule of three, or by rules of practice, it is therefore unnecessary to enlarge upon them, as the design of this book is calculated to treat upon other equally interesting and entertaining subjects.

NOTATION of VULGAR FRACTIONS.

**A** Fraction is a part or parts of an unit or whole thing, whether it be a yard, an ell, a foot, &c.

A fraction consists of two parts, numerator and denominator, thus:

4 numerator

7 denominator

iii. The numerator declares how many equal parts must be taken for the value of the fraction.

2d. The denominator declares how many equal parts the thing is divided, or imagined to be divided into

There are four sorts of fractions.

1st. Single or proper fractions; and these have their numerators less than their denominators, as,  $\frac{1}{2}$ .

2d. Compound fractions; and these have the word *interposed*, as  $\frac{7}{6}$  of  $\frac{3}{8}$ .

3. Improper fractions; and these have their numerators equal to, or greater than their denominators, as  $\frac{2}{2}$ ,  $\frac{29}{27}$ .

4th. Mixt numbers; and these are compos'd of integers and fractions, as 9 lb.  $\frac{3}{4}$

*Rule*

# *The Young Man's best Companion.* 143

*Rule.* 1. To abbreviate or reduce a single fraction into its least term, by a common measure.

*Note,* A common measure is any number that will divide both numerator and denominator, and leave no remainder. To find this common measure,

*Rule,* Divide the lower term by the upper, and that divisor by the remainder following, till nothing remain, the last divisor is the common measure, which will divide both numerator and denominator without a remainder; then divide both parts of the fraction by this common measure, and the quotients give the fraction required, reduced to its lowest terms. But

*Note,* If by continuing the division oftner than there are places of figures in the numerator, there is still a remainder, the fraction is already in its lowest terms, and cannot be reduced lower; again, if the common measure happens to be 1, the fraction is already in its lowest terms; and when a fraction hath cyphers to the right hand, it may be abbreviated by cutting them off, as  $\frac{410}{10}$  is  $\frac{41}{1}$ .

With the common measure divide the single fraction's numerator, the quotient is a new numerator; which being annexed together, is the single fraction sought, equal in value to the fraction given. And with the common measure divide the single fraction's denominator, the quotient is a new denominator, which being annexed together, is the single fraction sought, equal in value to the fraction given.

*Example.* Bring  $\frac{374}{526}$  into its last terms.

$$\begin{array}{r|l} 374 & 187 \\ \hline 526 & 263 \end{array}$$

Answer  $\frac{187}{263}$ .

Proof

$$\begin{array}{r} 526 \\ 187 \\ \hline 3682 \\ 4208 \\ 526 \\ \hline 98362 \end{array}$$

$$\begin{array}{r} 374 \\ 263 \\ \hline 1122 \\ 2244 \\ 748 \\ \hline 98362 \end{array}$$

Bring

144 *Youth's faithful Monitor: Or*

Bring  $\frac{46\frac{1}{2}}{642}$  into its least terms.

$$\begin{array}{r|l} (3) & \\ \hline 465 & 155 \\ \hline 642 & 214 \end{array}$$

Answer,  $\frac{155}{214}$  is equal to  $\frac{46\frac{1}{2}}{642}$ .

*Rule 2.*

To reduce compound-fractions to single.

Multiply the numerators and denominators together, the products are new numerators and denominators, which being annexed together, is the single fraction sought, equal in value to the compound fraction given.

*Examples.*

Reduce  $\frac{2}{3}$  of  $\frac{4}{5}$  of a pound, to a single fraction and its value.

$$\begin{array}{rcl} \frac{2}{3} \text{ of } \frac{4}{5} & \left| \frac{8}{15} \right. & \text{single.} \\ \frac{1}{3} \text{ of a } \mathcal{L}. \text{ is } 4\text{s.} & & 20\text{s.} \\ \frac{4}{3} \text{ multiplied } 4 & & 8 \\ \hline & & 15) 160 \text{ (10s. 8d.)} \\ & & \hline & & 10 \\ \frac{1}{3} \text{ of } \frac{4}{5} \text{ is } 5\text{s. 4d.} & & \hline \\ \frac{2}{3} \text{ of } \frac{4}{5} \text{ multiplied } 2 & & 12 \\ \hline \text{makes } 10 \text{ } 8 & & 15) 120 \text{ (8)} \\ & & \hline \end{array}$$

Answer  $\frac{8}{15}$ , or in value 10s. 8d.

Reduce  $\frac{3}{8}$  of  $\frac{2}{7}$  to single.

$$\begin{array}{rcl} \frac{3}{8} \text{ of } \frac{2}{7} & \left| \frac{6}{56} \right. & \left. \frac{3}{28} \right. \text{ single.} \\ & & (2) \end{array}$$

$$\begin{array}{r}
 208. \\
 \hline
 \frac{3}{7} \quad 2 \quad 10 \quad \frac{1}{2} \quad \frac{1}{7} \\
 \hline
 \frac{3}{7} \quad 5 \quad 8 \quad \frac{1}{2} \quad \frac{2}{7} \\
 \hline
 \frac{1}{8} \text{ of } \frac{3}{7} \quad 8 \quad \frac{1}{2} \quad \frac{2}{7} \\
 \hline
 \frac{3}{8} \text{ of } \frac{3}{7} \quad 2 \quad 1 \quad \frac{1}{2} \quad \frac{6}{7} \\
 \hline
 \end{array}$$

$$\begin{array}{r}
 208. \\
 \hline
 3 \\
 \hline
 28) 60 \text{ (2s. 1d. } \frac{1}{2} \frac{6}{7} \\
 \hline
 4 \\
 12 \\
 \hline
 28) 48 \text{ (1} \\
 \hline
 20 \\
 4 \\
 \hline
 28) 80 \text{ (} \frac{1}{2} \quad \frac{4}{24} \mid \frac{6}{28} \mid \frac{7}{7} \\
 \hline
 24 \quad 28 \mid 7
 \end{array}$$

Rule. 3.

To bring mixt Numbers into improper Fractions.

Multiply the integral part by the denominator of the fractional part; adding the numerator, and placing the product over the fraction's denominator; so that fraction is the improper fraction sought, equal in value to the mixt Number given.

Examples.

Bring  $3 \frac{2}{9}$  to improper.

$$\begin{array}{r}
 9 \\
 \hline
 32 \\
 \hline
 9 \text{ improper.} \\
 \hline
 \end{array}$$

Bring  $4 \frac{1}{27}$  to improper.

$$\begin{array}{r}
 27 \\
 \hline
 121 \\
 \hline
 27 \text{ improper.} \\
 \hline
 \end{array}$$

Bring  $7 \frac{2}{9}$  to improper.

$$\begin{array}{r}
 9 \\
 \hline
 65 \\
 \hline
 9
 \end{array}$$

## Rule 4.

*To bring improper Fractions into whole or mixt Numbers.*

Divide the numerator by the denominator, the quotient is the integral part; the remainders (if any) are the numerator, the divisor, the denominator of the fractional part, which being annexed to the integral part, is the mixt number sought = in value to the improper fraction given.

*Examples.*

Bring  $\frac{32}{9}$  to mixt.

$$\begin{array}{r} 9 \overline{) 32} \quad (3 \frac{5}{9} \text{ mixt.} \\ \underline{\phantom{00}27} \\ 5 \end{array}$$

Bring  $\frac{121}{27}$  to mixt.

$$\begin{array}{r} 27 \overline{) 121} \quad (4 \frac{13}{27} \text{ mixt.} \\ \underline{\phantom{00}108} \\ 13 \end{array}$$

Bring  $\frac{65}{9}$  to mixt.

$$\begin{array}{r} 9 \overline{) 65} \quad (7 \frac{2}{9} \text{ mixt.} \\ \underline{\phantom{00}63} \\ 2 \end{array}$$

## Rule 5.

*To bring Fractions of unequal Denominations, to Fractions of equal Denominators.*

First, If there be any compound fractions, they must be brought to single by Rule the second.

Secondly, Multiply each numerator into all the denominators, except its own denominator, to get new numerators; multiply all the denominators into each other, and you have a common denominator.

*Examples.*

1. Reduce  $\frac{2}{3}$  and  $\frac{4}{7}$  to a common denominator.

Here 2 in the first multiplied into 7 the denominator of the second, is 14, the new numerator for  $\frac{2}{3}$ ; and 4 multiplied into 4 the denominator of the first, is 16, the new numerator for the first; and the two denominators 4 and 7 multiplied into each other is 28, the common denominator; which put under 14 and 16 respectively, the reduced fractions will stand thus,  $\frac{14}{28}$  and  $\frac{16}{28}$ .

2. Reduce  $\frac{1}{2}$ ,  $\frac{3}{4}$  and  $\frac{5}{8}$  to a common denominator.

Beginning with the first fraction I multiply the numerator of it with the other two denominators, saying 1 by 4 is 4, and

and 4 by 8 the next denominator, is 32, which is one new numerator; next I multiply 3, the numerator of the second, by 2 the denominator of the first, whose product is 6, and that 6 by 8, the denominator of the third, produces 48, for another new numerator; lastly I multiply 5, the numerator of the last, by 2, the denominator of the first, whose product is 10, and that by 4 the denominator of the second, whose product is 40, for the third and last new numerator; thus three new numerators are obtained, *viz.* 32, 48 and 40, and the common denominator by multiplying the denominators 2, 4 and 8 into each other successively, produce 64, which is the common denominator, and then the reduced fractions will stand thus,  $\frac{32}{64}$ ,  $\frac{48}{64}$ ,  $\frac{40}{64}$ . In this manner may any number of fractions be reduced to a common denominator.

*Note.* It is best to begin with the first fraction to the left-hand, and so on to the right, then all the new numerators will stand in the same order as the old, and when the common denominator is obtained and properly placed under them respectively, each new fraction will respectively be of equal value to the old, though in different terms.

3. Bring  $\frac{5}{4}$ ,  $\frac{3}{7}$  and  $\frac{2}{7}$  to equal denominators.

$\frac{5}{4}$	$\frac{3}{7}$	$\frac{2}{7}$	$\frac{7}{4}$
<hr/>	<hr/>	<hr/>	<hr/>
20	21	14	28
$\frac{3}{4}$	$\frac{3}{7}$	$\frac{4}{7}$	$\frac{3}{4}$
<hr/>	<hr/>	<hr/>	<hr/>
60	63	56	84 c. d.
<hr/>	<hr/>	<hr/>	<hr/>
84	84	84	

## VALUATION of VULGAR FRACTIONS.

*Rule.* Multiply the numerator of the fraction propounded, by the number of known parts of the next inferior denomination, which are equal to the integer, and divide that product by the denominator: So is the quotient the value of the fraction in that inferior denomination; if there happens to be any fraction remain, find the value thereof in the next inferior denomination, by the rule aforesaid, and proceed till you come to the least known parts.

## Examples.

1. Find the value of
- $\frac{12}{32}$
- of a £ sterling.

$\begin{array}{r} 19 \\ 20 \text{ s. in a } \pounds. \\ \hline 32) 380 \text{ (11} \\ \hline 60 \\ \hline 28 \end{array}$	$\begin{array}{r} 28 \\ 12 \text{ pence in 1s.} \\ \hline 32) 336 \text{ (10} \\ \hline 0 \\ \hline \end{array}$	$\begin{array}{r} 16 \\ 4 \text{ farth. in 1d.} \\ \hline 32) 64 \text{ (2 farthings)} \\ \hline 16 \\ \hline \end{array}$
---	--	--

so that the value of  $\frac{12}{32}$  of a £. sterling is 11s. 10d.  $\frac{2}{3}$

2. What is the value of
- $\frac{10}{17}$
- of a tun of wine.

$\begin{array}{r} 10 \\ 252 \text{ galls. in a tun} \\ \hline 17) 2520 \text{ (148 galls.} \\ \hline 82 \\ \hline 140 \\ \hline 4 \end{array}$	$\begin{array}{r} 4 \\ 8 \text{ pints in a gallons.} \\ \hline 17) 32 \text{ (1 pint, } \frac{15}{17} \\ \hline 15 \\ \hline \end{array}$
--	---

Answer 148 gallons, 1 pint,  $\frac{15}{17}$ .

3. Find the value of
- $\frac{22}{32}$
- of a lb. troy.

$\begin{array}{r} 23 \\ 12 \text{ oz. in a lb.} \\ \hline 32) 276 \text{ (8 oz.} \\ \hline 20 \end{array}$	$\begin{array}{r} 20 \\ 20 \text{ dwts. in an oz.} \\ \hline 32) 400 \text{ (12 dwts.} \\ \hline 80 \\ \hline 16 \end{array}$	$\begin{array}{r} 16 \\ 24 \text{ grs. in a dwt.} \\ \hline 32) 384 \text{ (12 gr.} \\ \hline 64 \end{array}$
--	---	---

Answer 8 oz. 12 dwts. 12 grs.

ADDITION OF VULGAR FRACTIONS.

*When a simple Fraction is to be added to a simple.*

*Rule.* If the fractions are not in a common denominator, reduce them to one by rule 5th, then add the numerators together, and divide the sum by the common denominator, and the quotient is the sum required; and if any thing remain, place it over the divisor,

Ex. To  $\frac{2}{3}$  add  $\frac{5}{6}$ .

These fractions reduced to a common denominator, will stand thus,  $\frac{4}{6}$ ,  $\frac{5}{6}$ . Add 4 to 5, the two numerators, make 9, which divided, as under, by 6, the common denominator, the quotient or answer is  $1\frac{3}{6}$ , or  $1\frac{1}{2}$ .

$$\begin{array}{r} 18 \overline{) 27} \quad (1\frac{3}{6} \\ \underline{18} \phantom{00} \\ 9 \end{array}$$

*The Reason of the Rule foregoing.*

The reason why you are first to reduce your fractions to a common denominator, before you can know their total sum, is, because the aggregate of most fractions could otherwise never be discovered; for a fraction is more or less, according as the numerator is more or less in proportion to its denominator; so the numerators are only to be added. Now suppose (as in the foregoing example) that  $\frac{2}{3}$  is to be added to  $\frac{5}{6}$ ; in one of these fractions, the unit is divided into 6 parts, and in the other into 3 parts; now if I should add the numerators together, they make 7; but of which of these parts is not known; But if the fractions are reduced to a common denominator, their numerators will still retain the same proportion to their denominators; and when the unit is divided in both fractions into a like number of parts, the sum of those parts contained in each fraction, is the true aggregate of both fractions; so  $\frac{1}{4}$  and  $\frac{2}{4}$  is  $\frac{3}{4}$ ,  $\frac{7}{12}$  and  $\frac{1}{12}$  is  $\frac{8}{12}$ .

*When a mixt Number is to be added to a mixt.*

*Rule.* Work with the fractional parts as before, and afterwards add the sum of the fractions to the sum of the integers and you have your desire.

O 3

Ex.

150 *Youth's faithful Monitor: Or*

Ex. To  $4\frac{1}{2}$  add  $48\frac{1}{4}$ .

$\frac{1}{2}$  and  $\frac{1}{4}$  reduced to a common denominator, will be  $\frac{2}{4}$  and  $\frac{1}{4}$ , the sum of the two numerators is 3, which divided by 4, the quotient is  $1\frac{3}{4}$ , then

$$\begin{array}{r} 4 \\ 48 \\ 1\frac{3}{4} \\ \hline \end{array}$$

$53\frac{3}{4}$  the sum required.

*When a compound Fraction is to be added to a simple one.*

**Rule.** Reduce the compound fraction to a simple one, by your former directions; then find out the sum.

Ex. To  $\frac{1}{3}\frac{5}{7}$  add  $\frac{2}{3}$  of  $\frac{1}{4}$ .

The compound fractions reduced to a simple one, are  $\frac{5}{21}$  or  $\frac{1}{6}$ ; the common denominator of  $\frac{3}{6}$  and  $\frac{1}{6}$ , is  $\frac{1}{6}$  and  $\frac{1}{6}$ ; the sum of the numerators is 261, so that  $\frac{2}{3}\frac{5}{7}$  is the answer.

SUBTRACTION OF VULGAR FRACTIONS.

*When a single Fraction is to be deducted from a simple one.*

**Rule.** Reduce the fractions to a common denominator as before; then take the numerator of the subtrahend from the other, and place the remainder over the common denominator, and you have the difference sought.

The reason of this rule is plain from what was said of addition, as to the common denominators; and if the denominators are alike, the difference between their numerators is the difference between the fractions; as may be proved by adding that difference to the fraction subtrahend; as  $\frac{1}{4}$  from  $\frac{3}{4}$  rests  $\frac{2}{4}$ ; for  $\frac{2}{4}$  and  $\frac{1}{4}$  is  $\frac{3}{4}$ .

Ex. From  $\frac{3}{4}$  take  $\frac{1}{4}$ .

These fractions with a common denominator are  $\frac{3}{4}$  and  $\frac{1}{4}$ ; then take 1 from 3, rests 2, place the 2 over 4, and the answer will be  $\frac{2}{4}$  or  $\frac{1}{2}$ .

*When a compound Fraction is to be deducted from a simple Fraction.*

**Rule.** Reduce the compound fraction to a simple one; and then work as in the last case.

Ex.

Ex. From  $1\frac{1}{4}$  take  $\frac{2}{3}$  of  $\frac{8}{9}$ .

The compound fraction reduced to a simple, is  $\frac{16}{27}$ ; then  $\frac{1}{4}$  and  $\frac{16}{27}$  reduced to a common denomination will be  $\frac{3}{72}$  and  $\frac{224}{72}$ ; deduct 224 from 351, rests 127; so the answer is  $1\frac{127}{72}$ .

*When a simple Fraction is to be deducted from a whole Number.*

*Rule.* Deduct the numerator from the denominator, and place the remainder over the denominator; then deduct 1 from the integer, and place the remainder before the remaining fraction, and you have your answer.

Ex. From 12 take  $\frac{3}{8}$ : The answer is  $11\frac{5}{8}$ .

Or thus:

*Note,* That the 1 borrowed from the 12 (in the first method) is  $\frac{8}{8}$ , so that if from  $\frac{8}{8}$  you take  $\frac{3}{8}$  there rests  $\frac{5}{8}$ .

## MULTIPLICATION OF VULGAR FRACTIONS.

*When you are to multiply a simple Fraction by a simple one.*

Ex. Multiply  $\frac{1}{4}$  by  $\frac{2}{3}$ , answer  $\frac{6}{12}$  or  $\frac{1}{2}$ .

*Rule.* Multiply all the numerators one into another, for the numerator of the product, and likewise the denominators for the denominator of the product.

*Note,* That multiplication in fractions lessens the product, though in whole numbers it augments it.

Now the reason of the rule is, That if any fraction be multiplied by 1, it produces the fraction given; if by  $\frac{1}{2}$ , it produces half the fraction given, &c. So that to multiply  $\frac{1}{4}$  by  $\frac{2}{3}$ , produceth  $\frac{2}{3}$  of  $\frac{1}{4}$ , or  $\frac{6}{12}$ , or  $\frac{1}{2}$ , which is fully explained by the foregoing example.

*When you multiply a whole Number by a Fraction.*

*Rule.* Multiply the integer by the numerator of the fraction, and the product placed over the denominator is the answer.

Ex.

Ex. Multiply 561. by  $\frac{3}{4}$ .

$$\begin{array}{r}
 561 \\
 \times 3 \\
 \hline
 1683 \\
 \times 4 \\
 \hline
 6724
 \end{array}
 \left. \vphantom{\begin{array}{r} 561 \\ \times 3 \\ \hline 1683 \\ \times 4 \\ \hline 6724 \end{array}} \right\} \text{facit.}$$

This improper fraction  $\frac{1683}{4}$  reduced according to rule, makes but 421. which is less than 56; and confirms what was before asserted, *viz.* that multiplication of fractions lessens the product, &c.

*When you multiply a simple by a compound Fraction.*

*Rule.* Reduce the compound fraction into a simple one, and work as in the last case but one.

Ex. Multiply  $\frac{18}{5}$  by  $\frac{5}{9}$  of  $\frac{1}{7}$ . Ans.  $\frac{222}{1197}$  or  $\frac{10}{133}$ .

### DIVISION OF VULGAR FRACTIONS.

First, reduce all compound fractions to simple, and all mixt numbers to improper fractions, as before directed. Then multiply the numerator of the dividend, into the denominator of the divisor, for a new numerator; and the numerator of the divisor into the denominator of the dividend, for a new denominator, and you have the answer.

*To divide a simple Fraction by a simple.*

Ex. Divide  $\frac{11}{9}$  by  $\frac{4}{12}$ .

$$\begin{array}{r}
 12 \qquad 11 \qquad 48) 99 \ (2 \\
 \times 4 \qquad 9 \qquad \times 3 \qquad 3 \qquad 1 \\
 \hline
 48 \text{ den.} \quad 99 \text{ nom.} \quad 3) 48 \mid 16 \text{ Ans. } \frac{99}{48} \text{ or } 2\frac{3}{4}
 \end{array}$$

Here I multiply 11 into 9 for a new numerator, and 4 into 12 for a new denominator, which is  $\frac{99}{48}$ , here the answer is an improper fraction, but by changing the fractions, that is, if  $\frac{4}{12}$  were to be divided by  $\frac{11}{9}$ , then the answer would be  $\frac{48}{99}$ : which is a simple fraction.

*Note,* When the division is a simple fraction, or less than unity, it answers the same end as common multiplication; that is, increases the value.

Observe the following example:

It is required to bring 32 guineas into farthings by division only.

Here

## The Young Man's best Companion. 153

Here by Rule 2d, I reduce a farthing to the fraction of a guinea, and find it  $\frac{1}{1008}$  for a divisor; then I make 32 guineas a dividend, thus  $\frac{32}{1}$ : Now  $\frac{32}{1}$  divided by  $\frac{1}{1008} = 32256$  farthings.

From whence arises this observation, That when any whole Number is divided by a simple fraction, the quotient will be so much larger than the dividend, as the divisor is less than the unity or one; but on the contrary, when a simple fraction is to be divided by a whole number, then the quotient will be so many times less than the dividend, as the division exceeds unity, viz.

*To divide a whole Number by a simple Fraction.*

Ex. Divide 14 by  $\frac{1}{2}$ .

$$\begin{array}{r} \frac{1}{2}) 14 (70 \\ \underline{\phantom{00}} \end{array} \quad \text{Answer } 70$$

*When you divide a simple Fraction by a compound Fraction.*

*Rule.* Reduce the compound to a simple fraction, and work as in the last case but one.

Ex. Divide  $\frac{10}{33}$  by  $\frac{1}{2}$  of  $\frac{1}{3}$ . The compound fraction is  $\frac{10}{21}$ .

$$\frac{10}{21} \div \frac{1}{3} = \frac{10}{21} \times \frac{3}{1} = \frac{30}{21} \text{ or } \frac{10}{7}$$

*To divide a mixt Number by a mixt.*

Divide  $6\frac{1}{4}$  by  $4\frac{1}{2}$ .

Answer

Having shewed the Way of multiplying and dividing fractions, I shall here give you a question or two in the Rule of Three, and then proceed to Decimal Fractions.

*The RULE of THREE DIRECT, in Vulgar Fractions.*

Having reduced your fractions as before directed, proceed in all respects as directed in the common Rule of Three.

Or thus:

Having stated the question, and reduced the fractions multiply the denominator of the first Number by the numerator of the second; also multiply that product by the numerator of the third Number. and reserve this last product for a new numerator; again, multiply the numerator of the first number by the denominator of the second, and this product by the denominator of the third number, so shall this last product be a new denominator: This new fraction whose numerator and denominator is found, is the fourth number sought, which if it be a proper fraction, may be reduced into the known parts of the integer, by the Rule of Valuation. If an improper fraction, it may be reduced into a whole or mixt by rule 4th.

*Ex.* If  $\frac{4}{5}$  of an Ell English cost  $\frac{3}{11}$  of a £. what cost 51½ ells?

$\begin{array}{r} \frac{4}{5} \\ 5 \overline{) } \\ \hline 25 \\ 256 \overline{) } \\ \hline 1280 \\ 512 \overline{) } \\ \hline \end{array}$	$\begin{array}{r} 4 \\ 11 \overline{) } \\ \hline 44 \\ 5 \overline{) } \\ \hline 220 \text{ Denom.} \end{array}$	$\begin{array}{r} 51 \frac{1}{2} \\ 5 \overline{) } \\ \hline 256 \\ 5 \overline{) } \\ \hline \end{array}$

Ans. £. 357—5  $\frac{1}{4} \frac{1}{2}$

*Two Examples more for Practice.*

If  $\frac{2}{3}$  of 20lb. cost 36l. less  $\frac{1}{4}$  of 30l. what cost  $\frac{1}{2}$  of 40l. and  $\frac{1}{2}$  of  $\frac{2}{3}$  and  $\frac{3}{4}$ . Answer 35l.  $\frac{22}{10}$ , which may be found by valuation.

When  $\frac{1}{3}$  of 5 ells, less  $\frac{1}{5}$  of 1 ell, cost  $\frac{1}{8}$  of 9l.  $\frac{1}{2}$  less  $\frac{1}{4}$  of a pound, what cost  $\frac{1}{6}$  of 6 ells, less  $\frac{1}{8}$  of an ell?

Answer, 1l.  $\frac{41}{384}$ .

*Notation of DECIMAL FRACTIONS.*

**A** Decimal is any number, whether with cypher before it or not, having a dot before them, thus, .3..045, .005, or .2175, &c. are decimals.

*A Table for the Notation of Integers and Decimals.*

Integers.			
Fifth Place	7	Tens of Thouf.	} Of Unities.
Fourth Place	3	Thousands	
Third Place	2	Hundreds	
Second Place	8	Tens (10	
First Place	5	Unities (under	
<hr/>			
First Place	8	Tenth Parts	} 1, or U. nity, &c.
Second Place	2	Hundredth Parts	
Third Place	3	Thousandth Parts	
Fourth Place	7	Ten Thouf. Parts	
Decimal Parts.			

In the above table you may observe, that the place of integers or whole numbers is separated from the places of decimal parts of 1 (or unity) by a point or dot, so the number on the left-hand of the point expresses 73285 integers or unities, but the lower number expresses only 8237 parts of 1, or an integer, supposed to be divided into 10000 equal parts. In like manner this number 5.8 signifies 5 integers and 8 tenth parts of an integer; and 285.82 signifies 285 integers, or unities, and 82 hundred parts of an integer, &c.

*Reduction of Vulgar Fractions into Decimals.*

The proportion is thus: As the denominator of the vulgar fractions given, is to its numerator; so is 100, or 1000, &c. to the numerator of a decimal, whose denominator is 100, 1000, &c.

Ex.

*The Young Man's best Companion.* 157

Ex. Reduce  $\frac{1}{8}$  of a pound sterling, to its correspondent decimal.

$$\begin{array}{r} \text{If } 8 \text{ ————— } 3 \text{ ————— } 1000 \\ \phantom{\text{If } 8 \text{ ————— } 3 \text{ ————— }} \underline{3} \\ 8) 3000 \\ \underline{24} \end{array}$$

Answer,  $\text{r}^{\text{375}}$

.375

Or thus, Annex a cypher at discretion to the numerator, and divide by the denominator.

Reduce  $\frac{2}{11}$  of a £. sterling, to its correspondent decimal.

$$\begin{array}{r} 11) 900000 \\ \underline{22} \end{array}$$

.81818 (2

Answer,  $\text{r}^{\text{81818}}$

the remainder is so inconsiderable, they being less than  $\frac{1}{10000}$  of an unit, there is no occasion for any notice being taken of them.

Reduce  $\frac{1}{5}$  of  $\frac{6}{7}$  to its correspondent decimal.

1	6	42) 500000 (.11904
5	7	....
<u>5</u>	<u>7</u>	<u>80</u>
Num.	Denom.	380
		<u>200</u>
		32

Answer,  $\text{r}^{\text{11904}}$

Reduce  $\frac{6}{7}$  of  $\frac{4}{5}$  to its correspondent decimal.

6	7	63) 2400000 (38095
4	9	....
<u>4</u>	<u>9</u>	<u>510</u>
24 Num.	63 Denom.	600
		<u>330</u>
		15

Answer,  $\text{r}^{\text{38095}}$

*To reduce the known Parts of Money, Weight, or Measure to a Decimal.*

Add cyphers to the lowest denomination (making a dot between the cyphers and figure) and divide by the parts contained in the next higher denomination, then place the next higher denomination before that quotient (with a dot between) and divide by the parts contained in the next higher denomination; and so go on, and your last quotient will be the decimal required.

Ex. 1. What is the decimal of 12s. 6d.  $\frac{3}{4}$ ?

$$\begin{array}{r} 4) 3.00000 \\ \hline 12) 6.75000 \\ \hline 2|0 12.56250 \\ \hline \end{array}$$

.628125 Anf.

Here, according to the rule, I add cyphers to the lowest denomination, 3 farthings, and divide by 4; then I place the 6d. before that quotient, and divide by 12. Lastly, I place 12s. before this last quotient, and divide by 20, v.z. by 2, without cutting any figure or cypher off to the right-hand; for there is no occasion for that.

See the proof of this in example 1, next case.

2. What is the decimal of 18s. 9d.  $\frac{1}{2}$ ? Anf. 93958.

*Note 1.* If you would know the decimal of any number of shillings, from 1 to 19, observe this general rule: If the shillings be even, take the  $\frac{1}{2}$  of them is the decimal. Thus, the decimal of 16s. is 8, and of 18s. is 9. &c. But if the shillings be odd, multiplying them by 5, gives the decimal. Thus the decimal of 5s. is .25; for 5 shillings is  $\frac{1}{4}$  of a £, and .25 is  $\frac{1}{4}$  of 100. So also, the decimal of 17s. is .85, and 11s. is 55, and the decimal of 1s. is .05; for there must be two places when the shillings are odd.

*A Rule to find the decimal of Shillings, Pence and Farthings, at once; a £. Sterling being the Integer.*

1. For shillings. Add cyphers to the shillings, and divide by 20.

2. For the Pence. Add cyphers to the given pence, and divide by 240, the pence in a £. pricking off according to the rule of division. Thus you will find the decimal of 6d. .025 and of 3d. .0125.

3. For

3. For farthings. Add cyphers, and divide by 960:  
Thus the decimal of 3 farthings is .003135.

*Note,* The same is to be observed in finding the decimal of weight, measure and time, by adding cyphers to the given denomination, and dividing by the parts contained in the integer.

	.003906	2
	.001953	1

•• The use of the foregoing tables is very plain, one column in each table contains the shillings, ounces, bushels, &c. and against the said number in the other column, the decimal parts, answering thereto. Thus against 9 shillings in the first table you will find .45. Against 9 ounces in the second table .75.

If the exact number is not found in the tables, you must add the numbers together, of which it is compounded. Thus if the decimal parts of fifteen grains are sought in the second table; the decimal 10 grains is .001736, and 5 is .000868, the sum will be .00260, the decimal sought.

*To tell the Decimal of Shillings, Pence and Farthings, by inspection.*

*Note.* If the shillings be even, take the half of them, which will be the first decimal figure; then bring the pence and farthings into farthings, and if they be less than 5, join them to the first decimal figure, so have you a decimal of three places; but if the farthings be more than 5, set down 1 more than they really are; if they be above 40, set down 2 more than they amount to; so have you the decimal nearly.

*Examples.*

1. Let it be required to find the decimal of 14<sup>s</sup>. 6d.  $\frac{3}{4}$  and 18<sup>s</sup>. 9d.  $\frac{1}{2}$ , as before. Here I say, the  $\frac{1}{2}$  of 14 is 7, the first figure; then 6d.  $\frac{3}{4}$  is 27 farthings, but being above 5, I set down 28 farthings by the side of the 7, so is the decimal .728 as before; and so for the other.

2. What is the Decimal of 6s. 10d.  $\frac{1}{2}$ ? Answ. .344.

Here the  $\frac{1}{2}$  of 6s. is 3, and 10d.  $\frac{1}{2}$  is 42 farthings; but being above 40, I, by the rule, set down 2 more, viz. 44; so is the decimal .344 nearly.

*Note.* when the shillings are odd, multiply them by 5, and bring the pence and farthings into farthings, as before, and set the first figure under the second figure of the decimal belonging to the shillings, encreasing them by 1, or 2, as before, you have the decimal.

3. What is the decimal of 17s. and 6d.  $\frac{3}{4}$ , and 11s. 10d.

$\frac{1}{4}$

17 multiplied by 5 is 85  
6 $\frac{3}{4}$  more 1 farthing 28

$11 \times 2 = 22$   
10d.  $\frac{1}{4} + 2 + 45$

Answ. .878

.595

The next case is a proof to this, and more useful.

To

*To find the Value of a decimal in Money, Weight or Measure.*

Multiply the decimal by the parts contained in the integer, and prick off as many figures as there are places in the given decimal, and the figures towards the left hand will be whole numbers, and those that are pricked off are decimals, which decimals only must be multiplied by the next denomination: Thus go on, multiplying and pricking off the same number of decimals; so will the figures towards the left hand be the value required.

*Examples.*

1. What is the .628125 of a £ sterling?

$$\begin{array}{r} .628125 \\ 20 \end{array}$$

$$\begin{array}{r} 3. 12.562500 \\ 12 \end{array}$$

$$\begin{array}{r} d. 6.7500 \\ 4 \end{array}$$

$$\begin{array}{r} qrs. 3.00 \end{array}$$

Answer, 2s. 6d.  $\frac{3}{4}$ . See Ex. 1. of the last case.

2. What is the .7615 of a guinea?

$$\begin{array}{r} .7615 \\ 21 \end{array}$$

$$\begin{array}{r} 7615 \\ 15230 \end{array}$$

$$\begin{array}{r} 3. 15.9915 \\ 12 \end{array}$$

$$\begin{array}{r} d. 11.8980 \\ 4 \end{array}$$

$$\begin{array}{r} 3.5920 \end{array}$$

Answer, 15s. 11d.  $\frac{3}{4}$ .

3. What

3. What is the .1756 of a ton?

$$\begin{array}{r}
 \text{20} \\
 \hline
 \text{cwt. 3.5120} \\
 \text{4} \\
 \hline
 \text{qrs. 2.0480} \\
 \text{28} \\
 \hline
 \text{3840} \\
 \text{960} \\
 \hline
 \text{lb. 1.3440} \\
 \text{16} \\
 \hline
 \text{oz. 5.5040} \\
 \hline
 \end{array}$$

Answer, 3 cwt. 2 qrs. 1 lb. 5 oz.

4. What is the .09715 of a barrel?

$$\begin{array}{r}
 \text{36} \\
 \hline
 \text{58290} \\
 \text{29145} \\
 \hline
 \text{Gall. 3.49740} \\
 \text{8} \\
 \hline
 \text{Pints 3.97920} \\
 \hline
 \end{array}$$

Answer, 3 galls. 3 pints and  $\frac{2}{10}$ , or very near  $3\frac{1}{2}$  gall.

*To tell the Value of any Decimal in Shillings, Pence, and Farthings, by Inspection only, at a £ sterling the Integer.*

Double the first decimal place towards the left-hand, and if the second figure be under 5, then the first figure doubled will be the shillings; but if the second figure be 5, or above 5, then you must add 1 shilling more to those you doubled; and what remains over the 5 carry to the next figure, placing it before it in your mind, and those will be the farthings, which, if under 5, set down what they

they amount to; if above 5, not exceeding 40, then abate or set down 1 farthing less than they are; and if above 40, set down 2 less than they really are, and you have the value required.

*Examples.*

1. What is the value of .728125 of a £. Answer 14s. 6d.  $\frac{3}{4}$ .

Here I double the first figure 7, which is 14, for the shillings, and then I say, 28 farthings is 7d. but I abate 1, because it is above 5, so it is 14s. 6d.  $\frac{3}{4}$ .

2. What is the .39525 of a £. Answer 7s. 10d.  $\frac{3}{4}$ .

Here I say twice 3 is 6, and the next figure being above 5, I count 1 more, which is 7 shillings; then there is 4 remains from the 9, which I carry to the 5, which is 45 farthings; but being above 40, I abate 2, and call it 43 farthings, which is 10d.  $\frac{3}{4}$ .

3. What is .0672 of a £ sterling? Answer 1s. 4d.

Here the cypher doubled is 0; but the second figure being 6, that is 1 shilling and 1 over, which I carry to the 7, is 17 farthings, and abating 1 farthing is 16, or 4 pence; which you may prove by multiplying the decimal by 20, 12 and 4, pricking off, as before directed.

*Examples for Exercise.*

4. What is .8145 of a ton? Answer 16cwt. 1qr. 4lb. 7oz. 10dwt. .88

5. What is the .275 of a lb troy? Answer 3oz. 6dwts.

6. What is the .0729 of a year, at 365 days the integer? Answer, 26 days, 12 hours, 12 minutes. 14 seconds.

## ADDITION OF DECIMAL FRACTIONS.

TO such as well understand the notation of decimal fractions, all the varieties of their numeration, viz. addition, subtraction and so forth, will be as easy as the operations by whole numbers.

2. When divers decimal fractions are given to be added together, they must first of all be orderly placed one under another, according to the doctrine of their notation, viz. primes under primes, seconds under seconds, thirds under thirds, &c.

3. Having

3. Having placed the decimals, and drawn a line underneath in the manner aforesaid, add them together, beginning with the outermost rank, towards the right hand (as hath been taught in addition of whole numbers of one denomination.)

53.7486	.5674	3.7894
70.245	.0017	4.36427
63.07	.64	5.15305
24.6	.548	6.9764
<hr/>	<hr/>	<hr/>
211.6636 total.	1.7571 total.	20.28312 total.

*The Reason of this Rule.*

The reason of adding decimals thus, will appear from that of vulgar fractions, after they are reduced to a common denominator, in which decimals always are the denominator to the decimal of the most places, being the common denominator, which is the divisor, and the sum of the numerator is the dividend.

SUBTRACTION OF DECIMALS.

Place the numbers as in addition, and proceed as in subtraction of whole numbers of one denomination.

From 139.0949	From 460.994	From 4389.0
Take 47.947	Take 194.8462	Take 210.3467
<hr/>	<hr/>	<hr/>
Rem. 91.1479	Rem. 266.1478	Rem. 4178.6533

This rule is the very same with that in vulgar fractions. Decimals always have a common denominator, as it is said before; so that the difference between the numerators or numbers given, is the numerator of the answer, as in vulgar fractions. *N. B.* To supply the vacant places or figures, you put or imagine cyphers.

MULTIPLICATION OF DECIMALS.

In this rule you are to place the factors, and work as in whole numbers: But after you have found the product, observe this general

*Rule.* As many decimal places as you have in both the factors, so many places you must prick off towards the right-

right-hand of the product. And if so many places happen not to be contained in the said product, (as it will happen when you multiply two fractions together, that are of little value) you are to make up the number by adding cyphers towards the left hand of the said product.

The reason of this rule is plain, it differing nothing from that given for multiplying vulgar fractions: for by multiplying the sums given together, you multiply the numerators; and by cutting off as many as are in both decimals given, you multiply the denominators, and divide that of the numerators by the product of the denominators. Thus, to multiply  $\frac{1}{2}$  by  $\frac{3}{4}$ , is the same as .75 by 5, and 100 by 10, viz.  $\frac{75}{100}$  by  $\frac{5}{10}$ , for 5 times 75 is 375; and 10 times 100 is 1000. So the product is  $\frac{375}{1000}$  or .375.

*Examples.*

1. Multiply 2.316  
by 17.02

## DIVISION of DECIMALS.

Division is the same with that of whole numbers; all the difficulty thereof is, to know how many decimal places

to prick off towards the right-hand of the quotient: For which take this

*Rule.* Take Notice how many decimal places you have in the dividend, and how many in the divisor; and as many as the difference is, so many places you must prick off to the right hand of the quotient: but if so many places be not in the quotient, as the said difference, make up the number by prefixing cyphers towards the left hand.

Decimal fractions may also be divided as vulgar; as,

*Example.* Divide 24.56789 by 8.765

8.765) 24.86789 (283

73378

32589

Remains 6294

*Note,* That in this and most other Examples in division of decimals, it will be necessary to place cyphers toward the right hand of the dividend; and that you may know what number of cyphers to put to the right hand of any dividend, observe this

*Rule.* Consider how many decimal places you would have in the quotient (as 3 is sufficient, if it is not afterwards to be multiplied by any thing) and also how many decimal places you have in your divisor, and make so many decimal places in the dividend, by adding cyphers, if need require; as in the example, where 2.57 is divided by 12.3; and because I would have three decimals in the quotient, and there are two in the divisor, I must make 5 decimal places in the dividend.

1.23) 2.57000 (2.089

1100

1160

53 Remains.

Which being less than 1 thousandth part of a unit, is not material. So much for division.

Q

The

The rule of three and other rules, being the same with those in whole numbers, observing multiplication and division of decimals, I shall not encumber the book with them, but proceed to the extraction of the square root.

*The EXTRACTION of the SQUARE ROOT.*

**A** Square number is a number multiplied by itself, *viz.* any figure or figures multiplied by the same figure or figures, the product is the square of that number: Thus,  $2 \times 2 = 4$ , the square of 2; and  $9 \times 9 = 81$ , the square of 9.

The root is that from which the square is formed: Thus, I told you before, the square of 2 is 4, and the square of 9 is 81; therefore, *vice versa*, 2 is the root of 4, and 9 is the root of 81, as appears by the following table, which should be readily known.

Roots.	1	2	3	4	5	6	7	8	9	10	11	12
Squars.	1	4	9	16	25	36	49	64	81	100	121	144

I will shew you the whole process, which pray observe. Suppose it were required to extract the square root of 3136, or any other figures.

First, I set down the figures thus, 3136, and beginning at the units place, I make a dot or point over it, and also over every other figure towards the left hand, as you see in the margin; and pray observe, that as many dots as you have, so many figures the root will always consist of, which here are 2. Then

I seek (by the table) the nearest root to the figures contained in the first point of figures, *viz.* in 31, and find it to be 5, which I place in the quotient, thus, 3136 (5, which figure 5 is called the root, or part of the root. Then

Square the root, that is multiply it by 3136 (5  
itself, and place it under the said first 25  
point, as in common division, and subtract it therefrom, and bring down the 636 resolv.  
next point, *viz.* 36, and place it by the  
side of the remainder, it is 636, which is called the  
resolvend, as in the margin. Again,

I double

I double the quotient figure or root 5, which is 10, and making another crooked line, I place it for a divisor right against the Div 10)636 Resolvend, resolvend, as in the margin.

$$\begin{array}{r} 3136(5 \\ 25 \end{array}$$

Lastly, I now ask, (as in division) how many times 10 I can have in the resolvend

(always rejecting the last figure)

$$\begin{array}{r} 3136(56 \text{ root. Ans.} \\ 25 \end{array}$$

that is, how many times 10 are contained in 63, and find it 6 times, which 6 I put in the root by the side of the 5, and also by the side of the divisor 10, which makes 106; then I multiply 106 by 6, which is 636, and nothing remains: Thus I find the square root of 3136 to be 56.

$$\begin{array}{r} 106)636 \\ 636 \end{array}$$

*Proof.*

I square the root 56, that is, I multiply it by itself, viz. 56 by 56, and it gives 3136.

2. What is the square root of 56169?

56169 (237 root. Answer.

4

43)161 resolvend.

129

467) 3269 new resolvend.

3269

0

Here I proceed the same as in example 1, by making a dot over every other figure, and find the nearest root of the first point 5 to be 2, which I square and place under 5, and there remains 1, to which I bring down the next two figures 61, and it is 161; then I double the root 2, it is 4, which I place on the left hand for a divisor. Then I ask how many times 4 are contained in 16, which, though it be 4, yet upon trial will be but 3 times (for you must observe, it will often be less then it looks to be) which 3 I place in the quotient, and also by the side of the divisor 4.

Q 2

which

which makes it 43; then I multiply 43 by 3, and it is 129, and subtracting 129 from 161, I have 32 remains, to which I bring down the next point or two figures 69, and it is 32169, which I call a new resolvend; then I double the root 23, which is 46, for a new divisor, and ask how many times 46 I can have in 326, and find it 7, which I place in the quotient, and also after 46, and it is 467, which multiplied by 7, gives 3269. Thus I find the square root of 56169 to be 237. And for a proof I find 237 multiplied by 237 = 56169.

If you consider well the manner of the working the last example, if you have ever so many figures you may do it with ease. The remainders, if any, matters not at all; only when you come to prove the work, after multiplying the root by itself, you must add the remainder to the product, and it will be equal to the given number, if the work be right.

Suppose there is a tower 114 yards high, surrounded with a moat 20 feet broad; how long must a scaling ladder be to reach from the outside of the moat, to the top of the tower.

Answer, 342 feet  $\frac{400}{11}$ .

*Any two Sides of a right angled Triangle being given to find the third Side.*

This depends upon a mathematical proposition, in which it is proved, that the square of the hypotenuse, or longest side of a right angled triangle, is equal to the sum of the squares of the base and perpendicular; that is, of the other two sides.

*See fig. 12. in the copper plate the beginning of mensuration.*

Case 1. Let the base or ground B A represent the breadth of a moat or ditch, and the perpendicular B C the height of a castle, tower or city wall; and the hypotenuse A C the length of a scaling ladder.

In this figure, the base A B is supposed to contain 40 yards; and the perpendicular, or height of the tower or wall, 30 yards; what length will the hypotenuse A C, of the scaling ladder be?

*Ans.*

*Rule.* The square root of the sum of the squares of the base and perpendicular, is the length of the hypotenuse. See the work.

1600 the square of the base 40  
900 the square of the perpendicular 30

the sum 2500 (50 yards the root or length of the scaling ladder

25

(0)

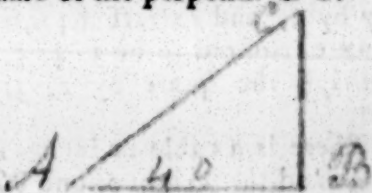

*Case 2.* If the length of the base, or breadth of the ditch were required; then the square root of the difference of the squares of the hypotenuse and perpendicular, is the length of the base, or breadth of the ditch or moat.

Thus 2500 the square of the hypoten. A C  
900 the square of the perpend. B C.

The diff. 1600 (40

16

(0)

*Case 3.* If the height of the tower or perpendicular B C were required; then the square root of the difference of the squares of the hypotenuse and base, is the height of the perpendicular B C.

A ladder 40 feet long may be so planted, that it shall reach a window 33 feet from the ground on one side of the street; and without moving it, at the foot, will reach a window of 21 feet high on the other side of the street: the breadth of the street is required. Answ. 36 feet,  $\frac{6}{10}$ .

*The Use of the Square Root applied to various Branches of the Mathematics.*

*A general Rule to find the third side of any Triangle, having two Sides given.*

*Note.* The perpendicular is that part which is right up; the base is that which lies next you, and the hypotenuse is the slanting side, called also the diagonal line.

Q 3

1. Having

174 *Youib's faithful Monitor: Or*

1. Having the perpendicular and base to find the hypothenuse, add the square of the base and perpendicular together, and extract the square root of them, you have the hypothenuse.

2. Having the hypothenuse and perpendicular, or base given, to find the other side.

From the square of the hypothenuse take the square of the base or perpendicular, and the square root is the other side required.

Suppose A B and C are three towers. A and B bear east and west distance 49 miles; and B and C bear north and south distance 127 miles. I demand the distance between A and C. Answ.  $136\frac{3}{4}$ .

If the difference of latitude is 78 leagues, and the departure 45 leagues, what is the distance? Answ. 90 leag.  $\frac{11}{12}$ .

Suppose a rope 55 inches round, I demand the compass of another rope, that is double the strength?

Square the compass of the rope, it is 25, which multiply by 2, and extract the square root, it is 7.07 inches. If it were required to be 3, 4, 5, or 6 times the strength, then multiply the square by 2, 3, 4, 5, or 6, and extract the root.

There is a cable 10 inches round, which weighs 21 cwt. I demand the weight of one 8 inches round? Answ. 13.44 C.

As the square of the one, viz. 100, is to the square of the other, viz. 64. so is the weight of the one to the other, viz. 13.44 cwt.

*The EXTRACTION of the CUBE ROOT.*

**A** Cube is that which has length, breadth and thickness. Thus, suppose a piece of wood to be cut into the form of a dye, which is equal every way in length, breadth and thickness, such as figure 6 in the plate, the beginning of mensuration, is called a solid, and by name a cube.

For any number multiplied by itself is a square; so any number multiplied twice into itself is a cube number: Thus the cube of 2 is 8: For  $2 \times 2$  is 4, and  $4 \times 2 = 8$ : So also the cube of 5 is 125: For  $5 \times 5 \times 5 = 125$ . Thus you see 8 is the cube, and the root of that cube. Also,

125 is a cube number, whose root is 5, as appears by the following table of both squares and cubes.

Roots.	1	2	3	4	5	6	7	8	9
Squares.	1	4	9	16	25	36	49	64	81
Cubes.	1	8	27	64	125	343	216	512	729

How the cube root is extracted, and a rule for it (I look upon) would be too tiresome for your memory, as there are many parts contained in it: I shall therefore take an example or two, and proceed in the whole process, or order of the work.

1. I demand the cube root of 32768? Answ. 32.

First, I make a dot over every third figure, beginning at the units place as in the margin, and as many dots as you have, so many places the root will contain, which here are two places, 32768. Then

Seek the root (or nearest root) to the first point 32, which (by the table) is 3, and place it in the quotient, which is the first figure in the root, thus 32678 (3. Then

Cube the figure which you put in the quotient, (that is  $3 \times 3 \times 3 = 27$ ) and place it under the first point 32, and subtract it therefrom, thus

$$\begin{array}{r} 32768 \text{ (3} \\ 27 \\ \hline 5 \end{array}$$

Again, To the remainder 5 bring down all the figures of the next point (viz. 768) and place them by the side of the remainder, and call this the resolvend, thus

$$\begin{array}{r} 32768 \text{ (3} \\ \hline 5768 \text{ resolvend.} \end{array}$$

Then triple the quotient, (that is, always multiply it by 3, be it what it will) and place the units place of it under

176 *Youth's Faithful Monitor: Or*

under the tens place of the resolvend, and call that the triple quotient, thus

$$\begin{array}{r} 32768 \quad (3 \\ 27 \end{array}$$

---

5768 resolvend.

---

9 triple quotient.

Now square the quotient (that is 9) and triple that square, that is 27, and place the units place of it under the ten's place of the triple quotient; that is, place it one figure more to the left hand, and call it the triple square, then add these two together, and call it the divisor,

$$\begin{array}{r} 32768 \quad (3 \\ 27 \end{array}$$

---

5768 resolvend.

---

9 triple quotient.

27 triple square.

---

279 divisor.

Then, ask how many times the divisor is contained in the resolvend, rejecting the last figure as you did in the square root; that is, ask how many times 279 you can have in 576, the resolvend, which here is 2, and place this also in the quotient, which now is 32.

$$\begin{array}{r} 32768 \quad (32 \\ 27 \end{array}$$

---

5768 resolvend.

---

9 triple quotient.

27 triple square.

---

279 divisor

Again, cube the figure last put in the quotient, (viz. 2, whose cube is 8) and place the units place under the units place of the resolvend.

32768

*The Young Man's best Companion.* 177

32768 (32 root.  
27

5768 resolvend.

9 triple quotient.  
27 triple square:

279 divisor.

8 cube of 2.

Then, Multiply the square of the figure last put in the quotient (viz. 4) into the triple quotient, viz. 36 (which is 36) and place the product one figure more towards the left hand.

32768 (32 root.  
27

5768 resolvend.

9 triple quotient:  
27 triple square.

279 divisor.

8 cube of 2  
36 the square of 2 by triple quotient

Again, multiply the triple square (viz. 27) by the last figure, put in the quotient, and place also this one figure more towards the left hand, which is 54.

32768 (32 root. Answ.  
27

5768 resolvend.

9 triple quotient.  
27 triple square.

279 divisor.

Lastly, add these three last numbers together as they stand and call it the subtrahend, which is 5768 equal to the resolvend.

8 cube of 2. (quo.  
36 square of 2 by triple  
54 triple sq. by the r. 2.

5768 subtrahend.

Thus

Thus is the work finished, and the cube-root of 32768 is found to be 32.

*Proof.*

For the proof of this I multiply 32 by 32, and it is 1024, which 1024 I multiply by 32 again, and have 32768.

*Note 1.* If the subtrahend had been larger than the resolvend, then I must put a less figure in the second place in the quotient, and proceed as before directed.

*Note 2.* When there is another point of figures to take down, first subtract the ~~subtrahend~~ subtrahend from the resolvend, and to the remainder bring down the next point, calling it new resolvend, or second resolvend: Then proceed to work as after the first resolvend, in every respect.

*Another Method to extract the Cube Root, which is, in many Respects, easier and shorter than the former.*

Let us take the last example 32768.

First, Find the root of the first point, as before, and subtract it therefrom, and to the remainder bring down the next point of figures and call it resolvend, or dividend, which you please. Then

Square the root, and multiply it by 300 for a divisor; and, as in common division, see how many times it is contained in the dividend, and place it in the quotient or root accordingly. Then

Multiply the divisor by the last figure of the root, and place it under the dividend (units under units) drawing a line between them.

Again, Square the last quotient figure, and multiply it by the first quotient figure, and that product multiply by 30, and set this under the last work, units under units, &c. Then

Cube the last figure, and put the units of this under the units of the last, and add these three together in order, as they stand, which is the subtrahend; which, if it be more than the resolvend, or dividend, you must put a less figure in the quotient, and proceed as before; but if it be less than the dividend, subtract it therefrom, and the work is done, for two figures in the root: But if there be more figures, bring them down to the remainder, and call it a new dividend; and square the whole root, and multiply it by

*The Young Man's best Companion.* 179

by 300, for a new divisor, and put the figures in the quotient. Then square this last figure, and multiply it by the foregoing figures in the root; and then by 30. Lastly, cube the last figure, and place it as before directed, and the work is done for three places. The same to be observed for more figures.

Thus the last example 32768 (32 root. Answ.

27

Divisor 2700) 5768 Dividend.

$$\begin{array}{r} 5400 \\ 360 \\ 8 \\ \hline 5768 \text{ Subtrahend.} \end{array}$$

I shall give you one sum at large, the first way; and leave you to prove it by the second; and then proceed to the use of the cube root.

Extract the cube root of 94862375.

94862375 (456

*The Use of the Cube Root.*

There is a cube, whose solidity is 1372 feet, I demand the side of a cube whose solidity is 4 times less? *Ans.* 7

Divide 1372 by 4, and extract the cube root.

If a bullet 2 inches diameter weighs 3 lb. what will one of the same metal weigh which is 3 inches diameter? *Ans.* 192 lb.

Solids being in triple proportion to their sides, or diameters, it is thus found.

As the cube of the given diameter is to the weight, so is the cube of the other diameter to the weight of the other required.

Suppose a shot of four inches diameter weighs 18 lb. I demand the diameter of another, that weighs 144 lb. *Ans.* 8 inches. This is the reverse of the last question.

There is a sphere or globe whose solid content is 250047 inches: I demand the side of a cube, whose solidity shall be equal to the solidity of the globe? *Ans.* 63 inches.

A country farmer lent his neighbour out of his haystack 20 feet of hay in length, breadth and depth, and his neighbour brought him home 10 feet at one time, and 10 at another: How is the balance, and who debtor? *Answer,* 6000 feet due to him that lent it; he having received but  $\frac{1}{4}$ th.

Suppose a ship, 300 tons burthen, 75 feet by the keel, 29  $\frac{1}{2}$  feet by the beam, and 14 feet deep in the hold; I demand the dimensions of another ship of the same make, of 500 tons burthen?

*Say,*

Say, As 300 ton is to 500 ton, so is the cube of the given keel to the cube of the ship's keel required, the cube root of which is 88.9 feet.

And thus for the other two dimensions, which I leave for your practice.

Having given the grounds of arithmetic, I come next to shew in as few words, and with all the plainness I can,

The ART of

BOOK - KEEPING,

After the *Italian* Method, by Way of Double Entry.

**T**HERE is good reason why most men of business are desirous to be masters of this art; for if kept regular and precise, a person may at any time know the state of his affairs, and consequently what he is worth to a farthing.

My Meaning in this rule shall be fully explained in all the usual cases, when I have shewed the books necessary for keeping accounts after this method.

The books of principal use are as follows, *viz.*

First, The WASTE-BOOK,

Wherein every thing is to be entered, whether received or paid, bought or sold, &c. without omission of any thing; together with the day of the month and the year of our Lord, inserted in the middle of the page: And is of no farther use, but only to remind the book-keeper, that such and such business is to be posted into the journal; and is ruled with one marginal line, and three lines for pounds, shillings and pence.

2. The JOURNAL.

Is a book into which every thing is posted out of the waste-book, which is here to distinguish debtor or creditor, and ought to be expressed in a better stile, or phrase of speaking more merchant-like; it being as it were a preparatory to the ledger, whereby is shewed what accounts are to be entered debtor in the ledger too, or creditor by other accounts. In this book the day of the month is also placed

in the middle of the page, which is never summed up; unless it contains only one man's accounts; and is ruled as the waste book.

### 3. The LEDGER

Is the chief book of accounts, and that in which all accounts meet, and are placed debtor on the left hand page, and creditor on the right: so that the folios on the right and left hand of this book are numbered alike; because one and the same account is placed on both sides. In this book the day of the month is placed in a narrow column towards the left-hand of the page, and the name of the month to the left hand of the day. At the head of each folio in this book is written the name of the city or place where the books are kept, with the year; all which you will see in the example of these three books after the several cases; the denomination of most of your accounts to be entered in this book, are thus ranked and explained.

First place your account of stock at the beginning of your ledger, viz. Make stock debtor to what you owe, when you begin to keep your books, let the debt be upon what account soever, in these words, on the left-hand folio as it lieth before you,

#### *Stock, Debtor.*

To sundry accounts, as per inventory, so much as the same is; or if you owe only one sum, say stock is Dr. as per inventory to that sum; and first of all having taken an inventory of all you are worth in cash, wares or debts, (as you see in the inventory following) write on the right-hand folio the sum of what you are worth, as appeareth by the particulars in the inventory, making stock creditor in these words.

#### *Per Contra Creditor.*

By sundry accounts as per inventory, mentioning the value of all the cash, wares and debts you have,

The next thing (on the same folio) is the account of cash, where note, that before you enter any thing debtor or creditor in your ledger, you are to look whether you have any thing of the same denomination in your inventory, which if you have, you must, the first thing in the account, make it debtor to stock for so much as is in the inventory of that account, as suppose you have in ready cash at the time of taking your inventory 2000 l. you must make, first

*Cash*

*Cash Debtor,*

To stock \_\_\_\_\_ l. 2000 : 00 : 00

And afterwards make the same accompt debtor to all persons from whom you receive any money, whether the same is in part or in full for wares sold, &c. But if you sell for ready money, you must make cash debtor to the wares; and the said persons of whom you receive, or thing for which you receive money, must be made in their own accompt creditor by cash, according to the general rule foregoing, as shall be shewn in the cases following.

Next to the accompt of cash in your ledger, you may put what accompt occurs in practice; as the accompt of men, wares, voyages, &c.

If a person buys wares of you, and pays not ready money, you are to make such person debtor to such wares, and the wares creditor by so much sold such a person.

When you ship off goods to your factor, to be sold for your accompt, you are in this book to keep an accompt of the voyage in a place by itself, as you do the rest, making *voyage to such a place (mentioning the port or place your factor resides at) consigned to such a person (mentioning your factor's name) debtor to the goods shipped, to custom, insurance, and all other charges of the same; and the contrary accompts creditor by voyage.*

When you have advice that the goods shipp'd are sold, then in some one place make *factor at such a place, my accompt current (which is the accompt running between your factor and you, concerning the goods sent him) debtor to voyage; and the voyage creditor by the accompt current, &c.*

In this book is also kept the accompt of profit and loss, by itself, thus:

*Profit and Loss Debtor.*

To what money you pay and have nothing for it; as to rebate of money paid you before due; to abatement by composition, when a person is insolvent; to household expences, servants wages, &c. And:

*Per Contra Creditor.*

By all the cash you receive, and deliver nothing for the same; as by money received with an apprentice; by rebate for paying a sum before due; by legacy left you by a friend, and by the sum you gain by every particular commodity

modity you deal in, or person you deal with, by ships in company, by voyages, &c.

At the beginning of this book, you are to have an alphabetical table of all the persons names you deal with, and commodities you deal in; with the account of profit and loss, voyages, accounts current, or in company, &c. referring to the folio in the ledger, where such account standeth.

#### 4. The CASH-BOOK

Is that wherein you enter all the money you receive, upon any account, on the left hand folio, making cash debtor to the thing you receive it for, &c. as was said before; and on the right hand folio enter all the cash you pay, creditor by the person you pay it to (mentioning whether it is in full or in part) or thing you pay it for, and place the day when you receive or pay it, as in the ledger, and when you see convenient, as once in a month or oftner, sum up your account of cash received and paid, carrying the sum to the account of cash in the ledger; which account, without this book would swell too big, provided you should enter the particulars there.

5. It is necessary you should keep a book to enter all the cash in, which you expend in house-keeping, and once in a month transfer the same to the debtor side in the ledger, thus:

#### *Household Expences, Debtor.*

To cash, so much as you bring from your book of household expences; and cash creditor, by household expences, in your cash book. In this book is likewise proper to enter the charge of apparel, rent of your dwelling-house, pocket expences, servants wages, &c.

#### 6. A BOOK OF CHARGES OF MERCHANTIZE,

Wherein you must enter the charge of custom, ware-house-room, postage of letters, portorage, cartage, wharfage, &c. and once in about a month, make a sum and transfer it into creditor side of your cash book, making a refer to the folio of the book of charges of merchandize.

#### 7. A BOOK OF FACTORIES OR INVOICES,

Which is an account of goods shipped or sent by you to your factor, or received from him, &c. In this book, enter the goods sent or shipped to be sold for your account, with the value and time when sent, on the left hand folio; and

and as you receive advice of their sale, enter the same on the right hand folio; so may you readily see how the account stands in that particular.

8. Besides these books, the merchant ought to have a book wherein to enter a copy of all letters he sendeth or receiveth upon account of trade also.

9. A pocket-book to take the minutes of what business you do abroad, for the ease of your memory, and to avoid error.

10. A small book wherein to enter all bills of exchange the merchant accepteth, with the sum and time when payable, and to whom; or if foreign bills, the foreign coin, exchange, and what the same is in sterling money; and as you pay the same, write [*Paid*] in the margin, against the bill paid.

Lastly, A book of receipts, wherein to take all the receipts for money you pay: Expressing first the day of the month, then the sum received, and for what, or whether in full or in part, and for whose use, which must be signed by the person receiving.

Thus have I given you an account of all the books necessary for a merchant to keep; also the nature of the account to be inserted in each book, and the use thereof. I shall next proceed to give such particular directions as will enable the book-keeper to find proper debtors and creditors, for most, if not all the cases he will meet with in the practice of merchandize, viz.

*How to enter in your Ledger proper Accounts in domestick Trade.*

*First*, When money is received, make cash Dr. to the party that paid it (if for his own account) and the party creditor by cash.

*Secondly*, If money is paid, make the receiver Dr. (if for his own account) and cash Cr.

*Thirdly*, When goods are bought for ready money, make the goods Dr. to cash, and cash Cr. by the goods.

*Fourthly*, When goods are sold for ready money, just the contrary, *i. e.* cash Dr. and the goods Cr.

*Fifthly*, When goods are bought at times, goods bought are Dr. to the seller of them, and the seller Cr. by the goods.

*Sixthly*, When goods are sold for time, just the contrary, *i. e.* the party that bought them is Dr. to the goods, and the goods Cr. by the party.

*Seventhly*, When goods are bought, part for ready money, and the rest for time; First, make the goods Dr. to the party for the whole: Secondly, make the party Dr. to cash, for the money paid him in part of those goods.

*Eighthly*, When goods are sold, part for ready money, and the rest for time: First make the party Dr. to the goods for the whole: Secondly, Cash Dr. to the party received of him in part of those goods.—Or either of these two last rules may be made Dr. to sundries; as goods bought Dr. to the selling man for so much as is left unpaid, and to cash for so much paid in ready money: And so on the contrary for goods sold.

*Lastly*, When you pay Money before it is due, and you are to have discount allowed, make the person Dr. to cash for so much as you pay him, and to profit and loss for the discount; or making the receiving man Dr. to sundries as before.

*To balance an Accompt when fully written.*

If the debtor side is more than the credit, make the old accompt creditor by the new: If the contrary, make the new accompt Dr. to the old; but in case the debtor side is less than the creditor, make the old accompt debtor to the new, and the new accompt creditor by the old.

In accompt of company, in which you have placed more received of another than his stock, then add as much on the debit side as you find on the credit side, that you may have so much debit in the new account as you put in, and as much credit as you received.

In accompts of merchandize, you must enter the profit and loss, before you make the old account creditor by the new, and the new debtor to the old for the remainder of goods unfold.

Observe that all accounts of goods are closed by profit and loss, provided they are all sold, if not, the accompts of goods must be made Cr. by balance, for the goods remaining unfold, and then closed by the accompt of profit and loss.

Observe, likewise, that dollars, crowns, and other foreign coins, are to be kept with a double column, as well

as their value in £. s. d. which have been paid or received by bills of exchange, for goods sold by factors or correspondents, or bought by them.

*When an Account is full written, how to remove it to another Folio.*

Add up the Dr. and Cr. sides and see the difference, which place to its opposite. As suppose the Dr. side exceeds the Cr. then you are to write balance on the Cr. side of the old account, to answer the line on the Dr. side of the new account.

*The METHOD of keeping the WASTE-BOOK, JOURNAL and LEDGER.*

## *The WASTE-BOOK*

Of me M. D. of London, merchant; containing all my dealings from the first day of July, 1765.

In the Name of God, *Amen.*

An inventory taken July the 1st; containing all my estate in cash, wares and debts, which I have at this day; and also what debts are owing by me to others.

My whole estate this day in money, wares and debts is 11505l. 10s. viz.

	l.	s.
In cash for trading occasions	10,000	
Also 21 pipes of sherry at } 25 l. 10s. per pipe }	535	10
30 hhds of tobacco at 10 l. —	300	
20 casks of brandy at 15 l. —	300	
$\frac{1}{2}$ part of the ship James —	200	
Andrew Smith owes me } per note on demand }	30	
Benj. Jones owes me per } not on'due Oct. 4. }	40	
Edw. Harret owes me per } bond, at 6 per cent. }	100	
		11505 10
		London,

London, July 1, 1765.

	l.	s.	d.
I owe as follows	l.	s.	d.
To John Smart on demand	40	0	0
To S. Easy, due 15 Dec. next	10	0	0
To Simon Noble	30	0	0
To Sir Peter King	200	0	0
	280		
5th, Andrew Smith has paid me in full	—	30	
7th, Paid John Smart in part	—	20	
8th, Bought of John Careless a pipe of port wine, for ready Money	—	27	
9th, Sold Simon Saveall, 3 hhds of tobacco, for ready money, at 11l. 5s.	—	33	15
11th, Bought of James Long, 3 hhds of sugar, at 19l. 14s.			
Paid $\frac{1}{2}$ down	29	11	0
Rest due on demand	29	11	0
	59	2	
Sold to Edward Ellis 12 pipes of sherry, at 30l.			
Received in ready money	70	0	0
Rest due at one month	290	0	0
	360		
12th, Lent Simon Johnson, upon bond, for 3 months at 6l. per annum	—	200	

London,

London, July 13, 1765.

l. s. d.

The owners of the ship James, bring in their account of freight, which amounts to 688 l. My  $\frac{1}{8}$  part which I have received, is

86

14th,

My cousin Kind is dead, and has left me a legacy of 500 l. to be paid in a year to come, by the executors A. B.

500

15th,

Bought of David Williams, and sent as adventure to Barbadoes, in the ship Swift, Capt. Thompson, master, consigned to Peter Careful, the following goods marked and numbered as per margin, viz,

7 pieces of holland at 18 l. 126 0 0

48 yards of scarlet cloth at

22 s.

52 16 0

Paid charges on said goods

7 4 0

186

16th,

Paid as a premium to John Evans for insuring 200 l. on my aforesaid adventure

10

18th,

Bartered with John Pennylefs, one pipe of sherry, at 32 l. for two bales of muslin of the same value

32

19th,

Paid my landlord one quarters rent, due at Midsummer day last

$\frac{3}{5}$	15th, Voyage to Barbadoes Dr. to fun- dries — 186 0 To David Williams for 7 pieces of holland at 18l. — 126 0 48 yards of scarlet cloth at 22s. 52 16 To cash paid charges — 7 4	186		
$\frac{3}{5}$	16th, Voyage to Barbadoes Dr. to cash 10l. Paid John Evans for insuring 200l. on my adventure —	10		
$\frac{4}{5}$	18th, Muslin Dr. to sherry — 32l. For 2 bales received in barter for 1 pipe	32		
$\frac{4}{1}$	19th, Household expences Dr. to cash 20l. Paid one quarter's rent due at Midsum- mer last —	20		

The short lines ruled against the journal entries, are termed *posting lines*, and the figure on top of the line denotes the *folio* of the ledger where the debtor is entered; and the figure under the line shews the *folio* of the ledger where the *credit* is entered; and the other figures against the *sundry debtors*, or *sundry creditors* (whether goods or persons) shew also in what *folio* of the ledger they are posted.

The accounts of persons and things are kept in the ledger, on opposite pages; and those which in the journal are said to be *debtors*, are entered on the left hand page, with the word *To*; and those, to which they are said to be *debtors*, are entered on the right-hand page, with the word *By*.

*How to balance at the Year's End, and thereby to know the State of your Affairs.*

Having closed your particular accompts, except stock, profit and loss, take a clean sheet of paper ruled for that purpose; then on the left hand folio make (balance Dr.) and on the other side (Per Contra Cr.) then even your accompts of cash, and bear the nett rest to balance Dr. Then cast up all your goods bought, and those sold, and see whether all the goods bought are sold or not: if any remain unsold, value them as they cost, or according to the present market-price; and make balance Dr. to goods unsold. Again, see what your goods cost severally, and how much they were sold for, and bear the nett gain or loss to the account of profit and loss. Then all the nett rests of your particular accompts in order as they lie, bring them severally to balance.

In short, balance is made debtor to all accompts for the sum that such accmpt is made creditor by balance; and balance is made creditor by all accompts for the sum that such accmpt is made debtor to balance; and profit and loss is made debtor and creditor in like manner to and by the accompts closed with profit and loss. And having closed these accompts, and entered the same in the account of balance, as taught before, close the account of profit and loss, by making the same Dr. to stock, for so much as the creditor side exceeds the debtor, and the contrary; which contrary seldom happens, for few that are careful in their business and trade, gain nothing. Then carry the foot of the account of profit and loss (if gain) to the creditor side of stock, if loss, to the debtor side. Then close the account of stock, as before taught for other accompts, and make balance Dr. To, or Cr. By, the excess of the Dr. or Cr. side of stock, as taught above, and in the example foregoing of stock and balance; and last of all, sum up the Dr. and Cr: sides of balance, and if the sums are equal, your books have been rightly kept, otherwise not.

*Note,* That in the account of stock, the sum you owed when you began trade, and your present stock, will always balance your former stock, and what you have gained by trading, if your accompts have been well kept.

*Maxima*

*Maxims and Rules to be observed in drawing and accepting  
Bills of Exchange, foreign and domestic.*

1. **B**ILLS are either foreign or domestic.

Foreign bills are usually payable in London, and other parts of England, at single, double or treble usance.

2. Domestic bills are usually payable, either at sight, or some number of days after.

3. A foreign bill payable at usance here in London, is payable a month and three days, (according to the custom of London) after the date of the bill.

4. If a foreign bill is not paid when due, it must be protested in the office of a public notary, who protesteth against the drawer, he on whom it is drawn, &c. for all charges, re charges, and interest to be paid by them.

5. After the bill is protested, the protest and bill is registered, and then the protest is returned; but it is usual, in kindness to him on whom it is drawn, to keep the bill three or four days longer.

6. If the bill is not yet paid, it is usual to go upon the exchange to see if any body will pay the said bill, for the honour of the drawer.

7. If any one is found that will pay it, he must likewise pay you the charges of the protest, and also the interest and other charges, which he afterwards charges on the drawer.

8. But if no one be found that will pay it, then the bill must be returned with the charges, interest, &c. to the drawer.

9. By an act, anno 9 and 10 Gulielmi III. Regis. It is enacted, that in such cities, towns or places, where no notary public resides, any substantial person of the city, town or place, in the presence of two or more credible witnesses, may act as such; refusal or neglect being first made of due payment of the same. And by an act Anno 3 and 4 Annæ Reginae, It is enacted, that all notes payable to any person or order, shall be assignable over in the same manner as inland bills of exchange are, or may be; and that any person to whom such note is indorsed, may maintain an action either against the person who signed such note, or against any of the persons that indorsed the same.

10. The

10. The allowance for payment over and above usance is different, according to the country, As

	Days	
At	{ London 3	Is allowed after the single, double, &c. usance.
	{ Rotterdam 6	
	{ Roan 5	
	{ Paris 10	
	{ Hamburg 12	
	{ Antwerp 14	

11. Though usance generally signifieth a month in bills drawn to and from London, yet from Venice to London, single usance is three months.

12. When you have money to receive from a foreign correspondent, you are to make your case known to an exchange broker, who will procure persons that will pay you your money here; you giving them your bill for the like sum, payable to their order by your correspondent; and in this case you are to enquire how the exchange goes to such a place where the money is payable, and make your bargain as to exchange as well as you can; which having done, draw your bill, mentioning the sterling coin, at so much foreign coin for so much sterling.

13. A domestick bill that is payable at sight, is not payable till three days after the person on whom it is drawn seeth it.

14. If a bill is accepted, the acceptor is become debtor to him, to whom the bill is payable. And

15. If a bill is accepted, and not paid in time, he to whom it is payable, may, by the law of merchants, seize the goods of the acceptor.

16. When a bill or note for money is made payable to another or order, if the person to whom it is payable goes not in person to receive the money, he must write his order on the backside of the bill or note, thus:

*I order the bearer A. B. to receive the contents of this bill or note.*

And afterwards subscribe your name.

17. When any one draws a bill payable to another, the drawer ought at the same opportunity, to give advice to him by whom it is payable, that he has drawn a bill on him payable to such a person, at such a time, for such a sum

sum, for the avoiding all suspicion of deceit in counterfeiting the drawer's hand, &c.

18. When part of the content of a note, &c. is only required to be paid, the sum paid in part must be endorsed on the backside of that part most wrote on, as cros the middle, &c. that so the endorsement cannot be cut off without defacing the bill.

19. If you draw a bill on any one that is indebted to you, and it be not paid in that time, which you think it might reasonably be, you must draw a second bill on him, mentioning it in the bill to be your second, third, &c. bill, payable to such a person, &c.

*The Form of an inland Bill.*

Norwich, July the 14th, 1765.

AT four days sight pay Mr. Henry Molyneux, or his order, Three hundred pounds, for the value received here of Ralph Rich, and place it to account, as per advice from

*Your humble servant,*

To Mr. Timothy Telfast, Matthew Mount.  
Merchant in London.

If this bill is not paid, draw a second, thus.

Norwich, July the 14th, 1765.

AT four days sight pay this my second bill of exchange (my first not being paid) to Mr. H. M. &c.

*A foreign Bill.*

London, July the 14th, 1765, for 600 l. 4s. 3d. sterling, 2 usance at 33s. Flemish, for 20s. sterling.

AT double usance pay this my first bill of exchange unto John Vanderstegen, or his order, six hundred and one pounds, four shillings, three-pence sterling, at thirty three shillings Flemish for one pound sterling, for the value received here of James Langrique, and place it to account, as per advice from

*Your friend and servant.*

To Mr. Dan. Dendardorp  
Merchant in Antwerp.

Timothy Trustnone.

*The Form of a Bill of Lading.*

SHIPPED, by the grace of God, in good order and well conditioned, by Edward Export, of London, merchant, in and upon the good ship called the (Bilboa Merchant of London) whereof is master under God, for the present voyage, (Martin Mizzen of London, Mariner) and now riding at anchor in (the port of London) and by God's grace bound for (Cadiz) to say (1 bale of stocking baize, and 1 trunk containing five hundred pair of silk stockings, contents, &c. as per invoice) being marked and numbered as per margin, and are to be delivered in the  
 TB  
 N<sup>o</sup>  
 1, 2. like good order at the aforesaid port of (Cadiz) the danger of the seas only excepted, unto (Mr. Thomas Drake, merchant, there) or to his assigns, he or they paying freight for the said goods (three pieces of eight per cwt.) with primage and average accustomed. In witness whereof the master or purser of the said ship hath affirmed to (three) bills of lading, all of this tenor and date, one of which (three) bills being accomplished, the other [two] to stand void. And so God send the good ship to her desired port in safety. *Amen.*

Dated in London the 6th of October, 1765. Infiles and contents unknown to  
 Martin Mizzen.

*Note,* The several words included in the Parentheses, are to be put into the several vacant places that are in a blank bill of lading.

*Note also,* Average is the general allowance made to the master of the ship, of 1d. or 2d. in every shilling freight; primage, a small allowance to be distributed among the sailors.

The Form of an Invoice.

Port Royal in Jamaica, July 24, Anno 1765.

INVOICE of five barrels of indico, five hhds. of sugar, and five hhds. of Pimento, shipped on board the John of London, Peter Green, commander, for account and risque of Messrs. James and Isaac Wood, of London, merchants, being marked and numbered as per margin; contents, costs and charges as in the following examples.

*Business at the Water Side, concerning Exporting and Importing of Goods, &c. Entering them at the Custom House, &c.*

**W**HEN there are goods to export, and ready packed, &c. there must first be made a bill of entry (as it is called) of the contents, after this form, *viz.*

In the Royal George, William Crowder, for Antigua,  
Charles Sendway,

Three cases of haberdashery,  
Five tuns of beer, &c.

Of these bills there must be seven, one of which must be in words at length, and the other may be expressed in figures: These are, by the clerks of the custom house, entered into several books for that purpose.—If some goods pay custom, and others not, then there must be made two entries; one for those that pay custom, and another for those that pay not; and likewise you must have two cockets.

A cocket testifies the payment of all duties; and is written on a small piece of parchment, in the following words:

Know ye, that Charles Sendway, merchant, for three cases of haberdashery, and five tuns of beer, in the Royal George, William Crowder for Antigua, hath paid all duties. Dated 9th of November, 1765.

On the backside of the cocket you must set down the marks, numbers, and quantity of the goods expressed in the inside.—When on clean paper you transcribe your bill of entry; upon which a shipping bill will be made out; on the back of which, signify the marks, numbers and contents, as before on the cocket; both of which being thus endorsed, you are to deliver them to the searcher at the water side, who deposits them in the office till the going away of the ship, and then they are delivered to the captain or master of the ship.

If you have not judgment or experience enough to enter your goods yourself, it is but applying yourself to any one of the clerks in the long-room, who make it their business (and good business too) to enter people's goods; and for a shilling (you giving them the contents) they will write

you bills, and pass your entries, without giving you any further trouble, or your running any risk of making any false entries, &c.

*Entry Inwards.*

**T**HE ship being arrived, search the entry-book in the long-room, and you will find the name of the ship and captain; as also the waiters that are to attend the delivery of the ship, and at what key the goods will be landed. The entry inward runs thus:

In the Mercury, John Keelhaul from Antigua.

25 hhds of sugar, &c.

56 bags of cotton, &c.

There must be eight of these bills [though but seven outwards] and one of these must be in words at length, [as well as one of the seven bills outwards] which is for the warrant of delivery; and must be signed by the person in whose name the goods are entered; and the mark also in the margin; which being done, and the fee for entry and custom paid, you will then have, from the land-waiters, a warrant for the landing and receiving your goods.

When goods are to be exported by certificate, viz. Foreign goods formerly imported; these goods being to be sent abroad, or exported to another place or country by a native of England within twelve, or a stranger within nine months after importation, entitles the exporter to a drawback of part of the custom paid at the importation of the said goods, [producing a certificate from the comptroller, that they have paid the duties inwards] and the debenture of custom drawback runs thus:

*Debenture.*

**C**HRISTOPHER Commerce, natural born, did on, &c. make an entry with us of two thousand ells of broad Germany linen, in the Adventure, Capt. Henry Smith, for Barbadoes, the Subsidy, &c. was paid inwards by, &c. as appears per certificate of the collector inwards: And for farther manifestation of his just dealing therein, he has also taken oath before us of the same.

Custom-house, London, 9th November, 1765.

*The*

*The Oath.*

*Jurat* C. C. That two thousand ells of broad Germany linen, above-mentioned, was really shipped out, and hath not been relanded in any port or creek in England or Wales since last shipped, Nov. 9, 1765.

*The Certificate Cocket.*

*London*, Know ye that C. C. for two thousand ells of broad Germany linen, paid per, &c. the day, &c. last, late unladen, and now in the Adventure, Captain Henry Smith for Barbadoes. Dated the 9th of November 1765.

This certificate cocket is gained by applying to the books of the importer, to know the day, &c. when the custom inwards was paid, and by whom, which carry to the long-room in the custom house, and deliver it to the comptroller's clerk of the subsidy inward and outward, with an account of what you would export, &c.

A little before was mentioned at what key the goods should be landed, and therefore here it is proper to name the keys (or rather quays) and wharfs that goods are usually landed at; which are these, viz.

Somer's-key, Smart's-key, Wiggin's-key, Bear-key, Dice-key, Customhouse-key, Potter's-key, Wool-key, Galley-key, Brewer's-key, Ralph's-key, Chester's-key, Lyon's-key, Cox's-key; Hammond's, Young's and Gaunt's keys. And the wharfs are Fresh-wharf and Botolph-wharf.

Besides these, there are certain places called Docks, which are harbours cut into the land, where there is no current, but only a flow, and an ebb, occasioned by the rise and fall of the tide in the river Thames; and these are convenient for the lying of vessels, hoys, lighters, barges and boats; and are these, viz.

Billingsgate-dock, Sabb's-dock, Tower-dock, St. Catherine's dock, Wappin-dock, Hermitage-dock, Execution-dock and Limehouse-dock. And above bridge Queen-hith-dock, Puddle-dock, White-Frier's-dock, and Scotland-Yard dock. And on Southwark or Surry side, are Saviour's-dock, Clink-dock, and Savery's-dock below the Bridge-yard, and several other for private uses.—But  
more

more particularly eminent on that side the water, is the Bridge-yard for landing sundry sorts of merchandizes, but chiefly from the ports of England.

*Of Wharfage and Lighterage.*

**W**Harfingers have several managers over them, and also a committee to redress grievances, &c. and clerks of the stations, with lighter managers, and have the letting of many warehouses (which now are very fine and commodious, being re-built since the sad fire in Thames street) cellars, &c. and have the privilege of keeping lighters for the carriage of goods to and from ships.

*The Rates of Wharfage,*

Are generally computed at 12d. per ton, whether outward or inward; excepting sugars from the West-Indies, which pay 2s. per ton, 4 hogsheds being accounted a ton (though they weigh more.) Crainage is included in the 12d. per ton wharfage; and for lighterage, the wharfingers have 12d. for 4 hhds. of sugar that come from the West-Indies; and for wine and other goods, the lighterage is half as much as the wharfage.

*Husbands of Ships.*

**W**HERE several Persons are concerned in a ship, there is usually a husband chosen by them to take an account of every merchant's goods, &c. and pay the wharfage, literage, portorage, &c. and these husbands are to collect every merchant's proportion, when they do the owner's freight.

*The Rates of Watermen, as set forth by the Lord-Mayer, and Court of Aldermen.*

		0 6

If a waterman takes or demands more than these rates, he is liable to pay forty shillings, and suffer half a year's imprisonment.

And if he refuses to carry any passenger or goods at these rates, upon complaint made to the Lord-Mayor and Court of Aldermen, he shall be suspended from his employ for 12 months.

**I**T is usual, when goods are sold, for the seller to deliver to the buyer, with the goods, a bill of parcels, which is a note of their contents and prices, with a total of their value cast up, &c.—These bills ought to be handsomely writ, and in a methodical order, according to the best and customary way of each particular Trade. I shall therefore shew the forms of bills of parcels in some trades and professions.

1 $\frac{1}{2}$ cwt. of ling, —	8	12	6	—	12	18	9
2 barrels of red Herrings, 2 : 12 : 6	2	12	6	per bar.	5	5	0
6 barrels of white ditto, 3 : 10 : 2	3	10	2	—	21	1	0

49 17

*Note.* Of haberdine or ling, 124 is a hundred ; of stock-fish and herrings, 120 to the hundred, 1200 to a thousand, and 12 Barrels to a last.

*Leatherfellers.*

Mr. Buckskin,

Bought of George Hide, Octob. 17, 1765.

	l.	s.	d.
15 large oiled lamb skins, at 0 : 1 : 3	0	1	3
13 kipp of goat skins, — 0 : 3 : 4	0	3	4
137 allum'd sheep skins, — 0 : 1 : 3	0	1	3
19 calve skins, — 0 : 4 : 3	0	4	3
60 dicker of hides, — 15 : 11 : 6	15	11	6

*Note,* 50 goat skins make a kipp, and other skins are five score to the hundred. A dicker is 10 hides or skins, and 20 dickers a last.

*Shoemakers.*

Mr. Tightfoot,

Bought of Moses Fitwell, July 18th, 1765.

Doz.	l.	s.	l.	s.	d.
15 Of Mens pumps, at — 4 : 4	4	4	per Doz.	63	0 : 0
8 Of double Channel — 4 : 15	4	15	—	38	0 : 0
6 Of turn'd Pumps — 3 : 10	3	10	—	21	0 : 0
3 Of Womens silk shoes, 6 : 5	6	5	—	18	15 : 0

## BILLS on BOOK DEBTS.

*A Woollen-draper's Bill.*

Mr. Francis Freeze, Dr.

1765. ————— To John Drab.

		s.	d.
Octob. 4.	To 16 yds. $\frac{1}{2}$ of black cloth at	18	3 $\frac{1}{4}$ yd.
	To 4 yds. $\frac{1}{8}$ of drap-de-berry at	15	6
Nov. 10.	To 35 yds. of mixt grey cloth	10	5
	To 9 yds. of fine ditto, at	17	3
Dec. 12.	To 12 yds. $\frac{3}{4}$ of fine broad cloth, ——— ———	17	3

If the gentleman pays the whole bill, then make the receipt thus :

Received the 14th of January, 1766, of Mr. Francis Freeze the sum of fifty-four pounds, &c. in full for my master John Drab.

£. 54, &amp;c.

per Matthew Measure.

*A Mercer's Bill.*

Mrs. Hannah Indolent, Dr.

1765. ————— To Henry Brisk.

	yds.	s.	d.
Octob. 4.	To 16 $\frac{1}{2}$ of flowered sattin, at	14	9 $\frac{1}{4}$ yd.
	To 14 of Venetian silk, at	11	8
Nov. 10.	To 14 of flowered damask,	9	7
	To $\frac{3}{4}$ of lutestring, at	4	7
Dec. 12.	To 5 $\frac{7}{8}$ of Genoa velvet, at	18	10

If part of the bill is paid, write thus :

Received of Mrs. Indolent, twelve pounds ten shillings, in part of payment, for my master Henry Brisk ;

£. 12 : 10

per Benjamin Follow.

# *The Young Man's best Companion.* 219

The several articles of these bills are purposely omitted being cast up, for the exercise of the reader in the rules of practice; or in those of multiplication of money, before shewn; which indeed is the best method of all, for the ready casting up the articles contained in any bill of parcels whatsoever.

## *Example.*

We'll take the last article of the mercer's bill, viz. 5 yds.  $\frac{7}{8}$ , &c. at 18s. 10d. per yard.

18—10	18—10
5 $\frac{7}{8}$	7
<hr/>	<hr/>
1. 4 14 2	8) 131 10
16 5 $\frac{1}{4}$	<hr/>
<hr/>	16 5 $\frac{1}{4}$
Facit 1. 5 10 7 $\frac{1}{4}$	

In this example the price is multiplied by the quantity, viz. 5 yards  $\frac{7}{8}$ , according to the rules delivered in multiplication; and the product by 5 is 4l. 14s. 2d. Then for the  $\frac{7}{8}$  of a yard: I multiply the price of the integer, viz. 18s. 10d. by the numerator of the fraction, viz. 7, and divide by the denominator 8, and the quotient is 16s. 5d.  $\frac{1}{4}$ , which 16s. 5d.  $\frac{1}{4}$ , added to the product of 18s. 10d. multiplied by 5, gives 5l. 10s. 7d.  $\frac{1}{4}$ , as in the operation above.

## *A Tayler's Bill.*

Mr. Richard Staytape Dr.

1765-----To Simon Buckram,

	l.	s.	d.
Aug. 6. To 2 $\frac{1}{2}$ Yds. of Broad-Cloth, } at 10s 6d. per Yd. — — }	1	6	3
----- To 5 Yards of Shalloon, at 2s. 3d.	0	11	3
----- To Buckram, Staytape and Canvas —	0	3	4
----- To Silk, Twist and Mohair — —	0	2	6
----- To Buttons — — — —	0	2	6
----- To making your Coat and Breeches	0	10	6

*A Stationer's Bill.*

Mr. Samuel Foolscap Dr.

1765—————To Timothy Paperskull.

		l.	s.	d.
June 4.	To 8 Ream of Demy Paper, at 12s. } $\text{q}^{\text{r}}$ Ream ————— }	4	16	0
July 6.	To 3 Ream of Foolscap superfine —	2	5	0
Ditto 14.	To 8 hundred of Quills — —	0	8	0
Aug. 6.	To 9 Spelling Books — —	0	6	0
Ditto 16.	To 4 Books of Arithmetic — —	0	15	0
————	To 6 rolls of parchment, at } 16s. 9d. $\text{q}^{\text{r}}$ roll. }	5	0	6

---

*Note,* A roll of parchment is 60 skins; A ream of paper 20 quires; and a bale of paper 10 reams.

*A Carpenter's Bill.*

Mr. John Slitdeal Dr.

1765—————To Freeman Wainfcot.

		s.	d.	l.	s.	d.
May 6.	To 18 whole Deals, at 1 : 9 each	1	11	6		
————	To 16 slit Deals, at 1 : 0 each	0	16	0		
June 5.	To 32 Feet of 3 by 4 at 0 : 2 $\text{q}^{\text{r}}$ ft.	0	5	4		
————	To 18 Feet of 6 by 8 at 0 : 8 —	0	12	0		
————	To Nails zod. 10d. 6d. and 4 penny } Nails, two hundred of each — }	0	6	8		
Ditto 9.	To 34 Days Work, at 2 : 4 $\text{q}^{\text{r}}$ day	3	19	4		

---

*A Brick.*

*A Bricklayer's Bill.*

Mr. Nathan Ridgetile Dr.

1765 ————— To Tobias Morter.

		l.	s.	d.
July 23.	To 9 Thousand of Bricks, } at 15s. 6d. $\frac{1}{2}$ Thousand	—	6	: 19 : 6
—	To 15 Ditto of Tiles, at 19s. 6d.	—	14	: 12 : 6
—	To 36 Ridge Tiles, at 1d. $\frac{1}{2}$ each	—	0	: 4 : 6
—	To 12 hundred of Lime, at 16s. $\frac{1}{2}$ C.	—	9	: 12 : 0
—	To 9 Load of Sand, at 3s. 6d. $\frac{1}{2}$ load	—	1	: 11 : 6
Sept. 28.	To 67 Days a Bricklayer, } at 2s. 4d. per Day	—	7	: 16 : 4
—	To 67 Days a Labourer, at 1s. 6d.	—	5	: 0 : 6

*Note,* 1000 plain tiles is 1 load; and 25 bags or bushels of lime 1 cwt. A brick must be 9 inches long, and 4 inches broad. Bricks are of three sorts, plaice bricks, red bricks, and grey stock bricks.

Here it will be convenient to give a general rule for the casting up any thing sold by the thousand; as bricks, tiles, clinkers, &c.

*The easy Rule is this.*

Multiply the given number by the shillings in the price, (if the price be at so many shillings per 1000) and always cut off three figures or places towards the right hand; and the figures towards the left hand are shillings, which divide by 20, to bring them into pounds; and those figures separated towards the right hand, multiply by 12, the next inferior denomination; and still cut off or separate three places towards the right hand, and the figures towards the left are pence; and the three last figures cut off, multiply by 4; and still separate three places towards the right hand, and the figures towards the left are farthings.—And if the price be shillings and pence, or shillings, pence and farthings per thousand, then multiply by the shillings as before, and take parts for the pence and farthings, as in the rule of practice; add these together and proceed as above directed.

*Example.*

$$\begin{array}{r}
 1840 \\
 15 \\
 \hline
 9200 \\
 1840 \\
 \hline
 27 \overline{)600} \\
 12 \\
 \hline
 7 \overline{)200} \\
 4 \\
 \hline
 800
 \end{array}$$

Answer, 27s. 7d. or 11. 7. 7d.

*Example.*

7870 plain tiles at 14s. 6d. per thousand.

$$\begin{array}{r}
 14 \\
 \hline
 31480 \\
 7870 \\
 6d. \text{ is } \frac{1}{2} \quad 3935 \\
 \hline
 114 \overline{)145} \\
 12 \\
 \hline
 1 \overline{)380} \\
 4 \\
 \hline
 1520
 \end{array}$$

When things are sold by the hundred, as Dutch and English pantiles, then follow this rule, viz.

Multiply the given quantity by the shillings in the price, and take parts for the pence and farthings (if any) as before, then from the right hand of the sum cut off two places, and proceed as in the last rule.

OF MENSURATION.

THE several kinds of measuring are three, viz.

1<sup>st</sup>, Lineal, by some called running measure, and is taken by a line, and respects length without breadth; the parts of which are,

12 inches 1 foot, 3 feet 1 yard, 16 feet and an half 1 rod, pole, or perch.

All kinds of ornamental work, such as cornice, freeze, &c. are measured by running measure.

2<sup>dly</sup>, Superficial, or square measure, is that which respects length and breadth, and the parts are,

144 inches 1 foot, 72 inches half a foot, 36 inches one quarter of a foot, 18 inches half a quarter of a foot, 272 feet and a quarter 1 rod, 136 feet half a rod; 1296 inches, or 9 feet, one superficial or square yard.

3<sup>dly</sup>, Solid, or cube measure, which respects length, breadth and depth, or thickness; and the parts are,

1728 inches 1 foot, 1296 inches three quarters of a foot 864 inches half a foot, 432 inches 1 quarter of a foot, and 27 feet 1 solid yard.

*Superficial Measure.*

TO measure things that have length and breadth, such as board, glass, pavement, wainscot, and land, is to take the dimensions of the length and breadth, according to the customary method used in each particular; for instance, board and glass are measured by the foot, the dimensions are taken in feet and inches, and the content given in feet.

*Of Flooring, Roofing, &c.*

*Quest.* How many clinkers 7 inches long, and 3 inches wide, will floor a yard 27 feet long, and 19 feet wide?

*Ans.* 3517  $\frac{1}{2}$ .

Multiply the length of the yard by the breadth, gives 513 feet; this multiply by 144, the square inches in a square foot, gives 73872 inches; this divide by 21, the inches in clinker, gives 3517  $\frac{1}{2}$ .

*Quest.* How many planks will floor a hall 60 feet  $\frac{1}{2}$  long, and 33 feet and  $\frac{1}{2}$  wide; when the planks are 15 feet long, and 15 inches wide? *Ans.* 108.

Multiply

## 224 *Youth's faithful Monitor: Or*

Multiply  $60 \times 33.5 = 2026.75$ . Then 15 feet  $\times 1.25$  feet (*viz.*) 15 inches, gives 18.75 feet for 1 plank: now  $2026.75 \div 18.75$ , gives 108 planks.

*Quest.* A thatcher thatches a barn 60 feet long, and 25 feet wide, and the two porches are each 15 feet long, and 10 feet deep, I demand how many squares are contained in it? *Answer*, 33 squares. *N. B.* 100 feet is 1 square.

Multiply 60 by 25, gives 1500 feet for 1 side, which doubled, gives 3000 for both the sides; then the porch, *viz.*  $15 \times 10$ , gives 150 for 1 side, which doubled, gives 300, which added to 3000 is 3300, which divided by 100 (that is, cutting off 2 figures) gives 33 squares.

### *Of Paving, Painting, Wainscoting, &c.*

Paving, painting, and wainscoting is measured by the square yard; 9 square feet being 1 yard.

*Quest.* A gentleman has a walk 32 yards long, and 12 feet wide, which is paved with stone; how many yards does it contain? *Ans.* 128 yards.

First, multiply 32 yards, *viz.* 96 feet by 12, gives 1152, which divide by 9, gives 128 yards.

*Quest.* There is a room 64 feet round, and 9 feet high, in which are two windows, each 6 feet high, and 3 feet wide, and the fire place contains 9 square feet; I demand how many yards of paper, half yard wide, will hang it? *Ans.* 118 yards.

First,  $64 \times 9 = 576$  yards, the content, out of which take 18 feet, each window, *viz.* 36 feet, and 9 the fire-place, is 45; and the remainder is 531 feet; which divide by 9, gives 59 yards, the content of the room; but as the paper is  $\frac{1}{2}$  yard wide only, it will take double this Number, *viz.* 118 yards, answer.

Painting, wainscoting, &c. are done by the yard square, and measured after this manner.

### *Proper directions for Joiners, Painters, Glaziers, &c.*

Rooms being various in their forms, take this general rule in all cases, *viz.*

Take a line, and apply one end of it to any corner of the room; then measure the room, going into every cor-  
ner

rer with the line, 'till you come to the place where you first began; then see how many feet and Inches the string contains, and set it down for the compass or round; then take the height by the same method.

Glaziers are to take the depth and breadth of their work, and multiply one by the other, dividing by 144; glass being measured as board.

Having thus shewn the methods of casting up dimensions, I come now to particulars; and the first of

*Glaziers Work, by the Foot.*

If the windows be square, multiply the length by the breadth, which will produce the contents, as abovesaid

*Example.*

By cross-multiplication.

Feet. in.

8—9 high.

7—3 broad

---

56—0

2—0

5—3

2 $\frac{1}{4}$

---

63—5 $\frac{1}{4}$

By practice.

Feet. in.

8—9

7 feet 3.

---

61—3

3 inches  $\frac{1}{4}$  2—2 $\frac{1}{4}$

---

63—5 $\frac{1}{4}$  Ans.

If the windows are arched, or have a curved form, no allowance is made, by reason of the extraordinary trouble, and waste of time, expence of waste of glass, &c. And the dimensions taken from the highest part of the arch, down to the bottom of the window, form the height or length, which multiply by the breadth, and the product will be the answer in feet, &c.

Glaziers are often so very nice as to take their dimensions, and to measure to a quarter of an inch.

*Example.*

## Examples.

	Feet.	In.
	4—	$3\frac{1}{2}$ long.
	2—	$7\frac{1}{4}$ broad.
	<hr/>	
	8—	7
	2—	$1\frac{3}{4}$
		$6\frac{1}{4}$
		1
	<hr/>	
	11—	$4\frac{1}{4}$
	<hr/>	

6 Inches is	$\frac{1}{2}$
1 $\frac{1}{2}$ is	$\frac{1}{4}$
$\frac{1}{4}$ is	$\frac{1}{6}$

To measure the Peak End of a House, or any Triangle.  
Fig. 3.

*Quest.* Let ABC be the peak end of a roof, whose base AC measures 24 feet, and the perpendicular line BD from the top of the peak 16, I demand how many square yards it contains;

Multiply  $\frac{1}{2}$  the perpendicular BD by the whole base, or line AC; or else, multiply the whole perpendicular BD by  $\frac{1}{2}$  the base AC, viz. AD, or CD, gives the content in feet, which divide by 100, gives the square, or by 9, gives square yards.

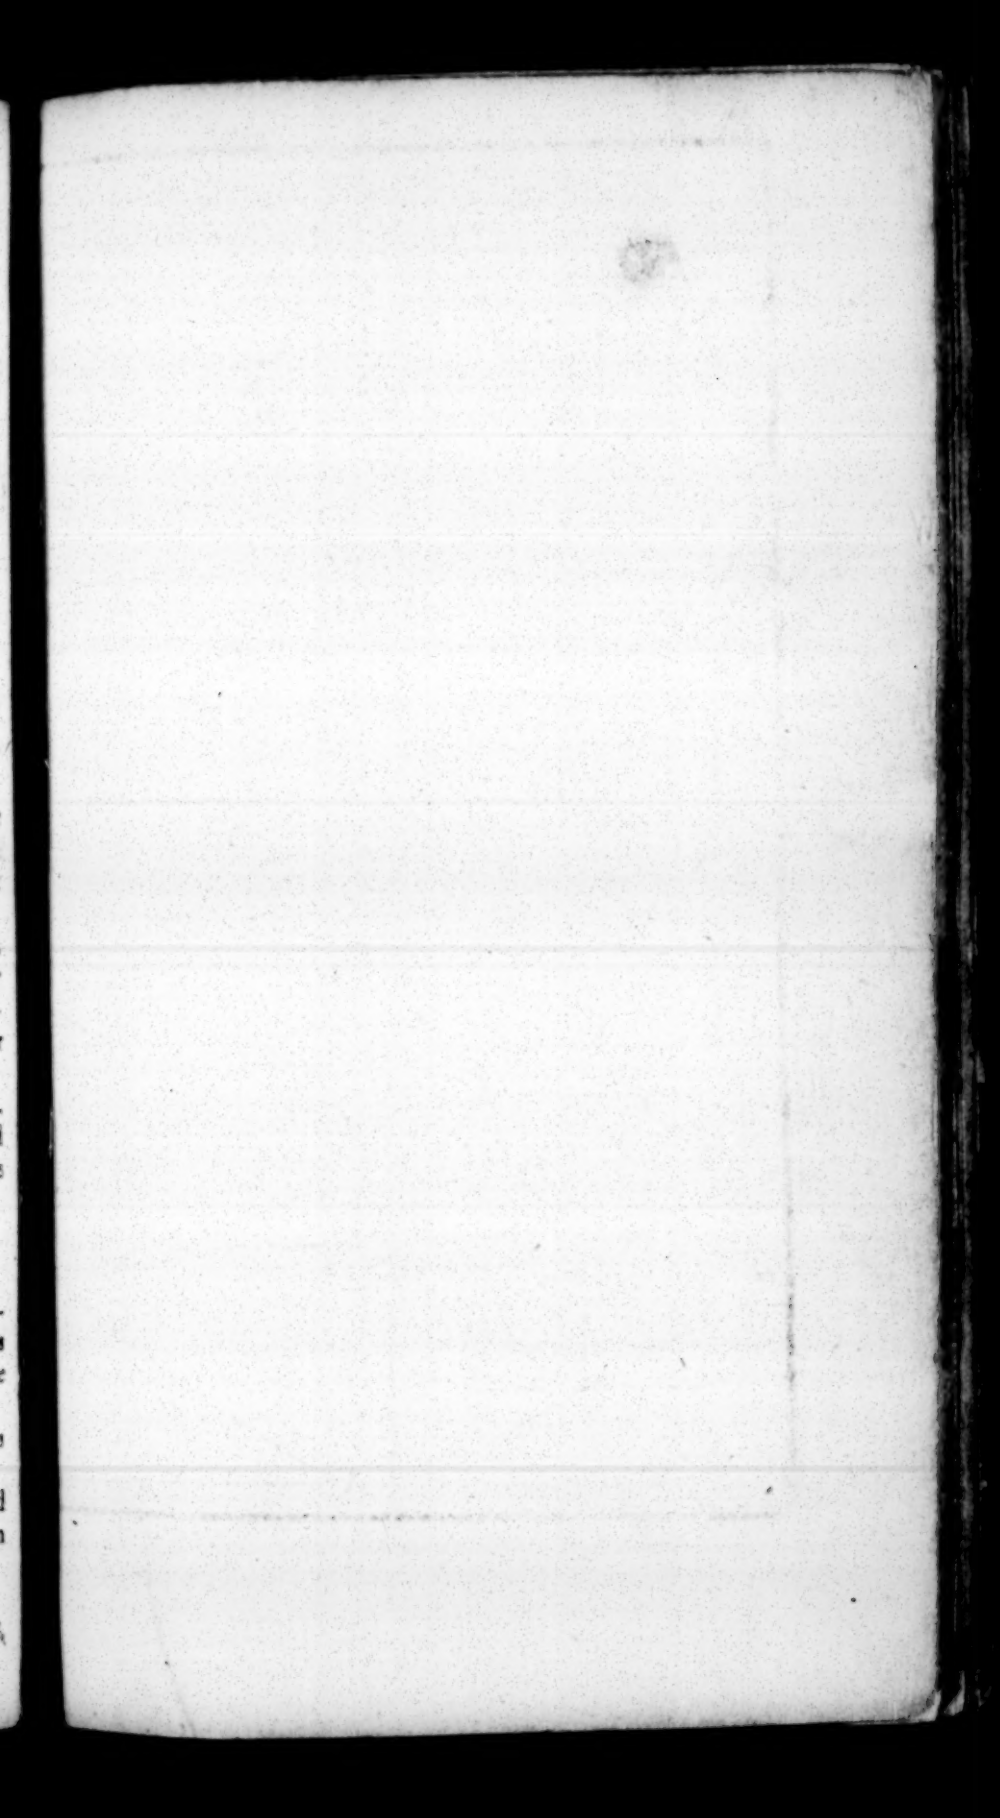

Thus AC 24 feet multiplied by  $\frac{1}{2}$  BD, 16 feet, (viz. 8 feet) gives 192 feet, viz, 1 square 92 feet; or divided by 9, gives  $21\frac{2}{3}$  square yards of plaistering. And thus for any triangle.

## Of Board and Timber Measure.

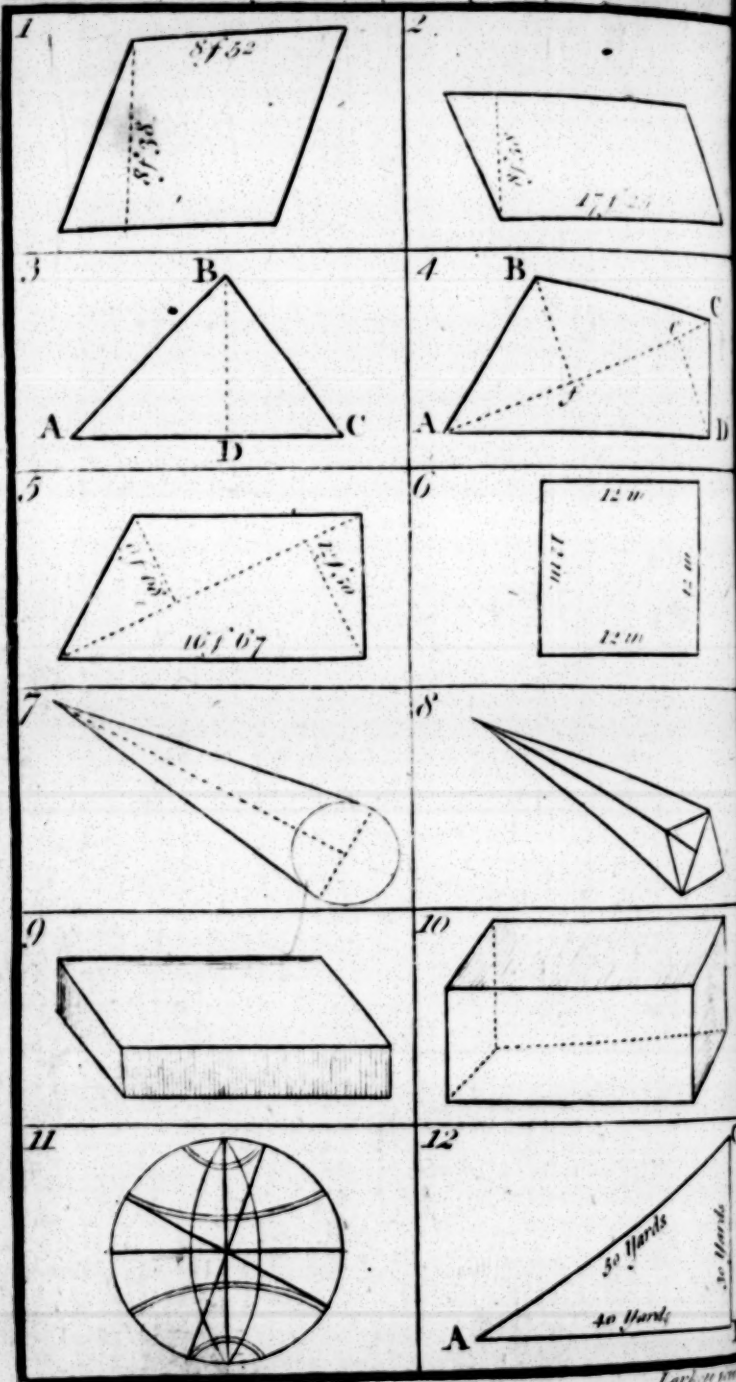

1. If the board be regular, multiply the length in inches by the breadth in inches, and divide by 144, gives the answer. Or, multiply the length in feet by the breadth in inches, and divide by 12, gives the answer.

*Quest.* There is a board 18 feet long, and 5 inches wide, how many feet does it contain? Ans.  $7\frac{1}{2}$  feet.

If the board be wider at one end than the other, add the two breadths together, and take half for a mean breadth, which multiply the length by as before directed.

Place this at the beginning of Measuring.

Larch 10 1000

*The Young Man's best Companion.* 227

*Quest.* There is a board 19 inches at one end, and 9 at the other, and 8 feet long, what is the content?

*Ans.* Add 19 to 9 make 28, half of which is 14, the mean breadth, which multiplied by 8 feet long make 112, which divided by 12 produces  $9\frac{1}{3}$  feet, the content required.

*To measure an oval Table, or Ellipsis, as suppose the Length be 36 Inches, and the Breadth 16.*

Multiply the longest diameter by the shortest, and the product multiply again by .7854, and the product is the answer in inches.

*Ex.* Suppose the diameter of a globe is 42 inches, what is the solid content, as *fig. 11.*

First, find the circumference thereof as follows, viz.

As 7 is to 22, so is 42 to 132.

$$\begin{array}{r} 42 \\ \hline 44 \\ 88 \\ \hline 7) 924 \end{array}$$

132 Circumference

Then multiply the circumference by the diameter, and multiply that product by  $\frac{1}{6}$  of the diameter, this last product will be the solid content required, viz.

$$\begin{array}{r} 132 \text{ Circumference} \\ 42 \text{ Diameter} \\ \hline 264 \\ 528 \\ \hline 5544 \text{ Products } \textit{diameter} \\ 7 \text{ the } \frac{1}{6} \text{ of the dividend} \end{array}$$

38808 the solid content in inches

which may be brought into solid feet or yards, by dividing by

by 1728 for feet, and for yards, by dividing the feet by 27.

If the circumference is given to find the diameter, proceed as follows, viz. as 2 is to 7, so is 132 to 42.

*Again.*

Multiply the circumference in feet by itself, and then that product by this decimal, 0,0353678, and this last product will be the content in yards.

To find the superficial content of a pyramid or cone, multiply half the sum of the sides, or half the circumference of the base by the slant height in feet, and the product divided by 9, will be square yards.

If the pyramid or cone be not compleat, that is, if a part of the top be wanting, add together the circumference at top and bottom, and half their sum being multiplied by the slant height, will be the superficial content.

It may not here be improper, as well for refreshing the memory, as for improving the understanding, and forming the mind with proper notions and ideas of measuring, to give a short repetition by demonstrative geometrical figures, to explain what hath been verbally and arithmetically before expressed.

*Superficial or flat Measure.*

Some of which is measured by the foot square; as are boards, glass, marble, free-stones and pavements. The dimensions are taken in feet and inches, and the content given in square feet.

*Example 1.*

Suppose there is an oblong or long square, let it be board, glass, or pavement, &c. that contains on the longest side (or the length) 24 feet and half, and the shortest side (or breadth) 14 feet  $\frac{1}{4}$ , as in the following figure, viz.

14	F. 24 $\frac{1}{2}$
14	Area or content is
14	349 F. 125

14.25 breadth.  
24.5 length.

$$\begin{array}{r} 7125 \\ 5700 \\ \hline 2850 \end{array}$$

$$\hline 349,125$$

*Rule.* Multiply the length by the breadth, and cut off as many places to the right-hand, as there are decimals in the length and breadth.

*Example 2:*

Suppose a board or piece of glass be in the form of figure the first, called a rhombus, that is, in the shape of a common pane of glass, or diamond-square

*Rule.* To measure which, multiply the breadth by the length of any of the sides (for they are all equal) and cut off as many places to the right-hand as there are decimal places in both multiplicand and multiplier, as hinted before: As suppose the breadth 8 feet 38 parts, and the length of the side to be 8 feet 52 parts, then the work will appear thus:

$$\begin{array}{r} \text{F. P.} \\ 8, 52 \\ 8, 38 \\ \hline 6816 \\ 2556 \\ \hline 6816 \end{array}$$

Here the multiplication is as in whole numbers, and the content or answer is found to be 71 square feet; and  $\frac{1276}{10000}$  ten thousandths of a foot, or 4 inches  $\frac{1}{4}$ .

$$\hline 71,3976$$

3976 is separated by a comma, as above directed, and are so many 10000 parts of a foot.

X

Ex-

## Example 3.

Again, admit a piece of measurement to be of the form of figure the second, called a rhomboides ; its length 17 feet 25 parts, and its breadth 8 feet 58 parts.

f. p.

17, 25 length.

8, 58 breadth.

The fore-mentioned figure hath its opposide sides equal, and its opposite angles alike.

$$\begin{array}{r} 13800 \\ 8625 \\ \hline 13800 \end{array}$$

148,0050 Answer ; the content is 148 feet

## Once more,

Suppose a board, piece of glass, pavement, or piece of land, to represent, or be in the form of a triangle, or three-corner'd figure, expressed as in the shape of figure the third. Every triangle is half an oblong, whose length and breadth is equal to the perpendicular and base.

*Note.* The dotted line is the perpendicular, the bottom line the base, and the line from the top of the perpendicular to the left angle of the base, is called the hypotenuse.

The measuring of a triangle hath been always shewn, and therefore I shall desist speaking any further thereto.

The fourth figure is called a trapezium, and consists of 4 sides : This figure, before it can be measured, must be divided into two triangles, thus, viz. by a line drawn from one angle or corner, to the angle opposite to it, as in the figure.

## Example 4.

Suppose the dimensions of the trapezium before described to be; viz. the base 16 F. 67 ; the one perpendicular 12 F. 50, and the other 9 F. 68 (as in figure 5) what is the content ?

The Operations.

F. P.

One perpendicular 12,50 } add  
The other 9,68 }

The sum is 22,18

The half sum is 11,09, which  
multiply by the whole base 16,67

produces 184,8703

which is 148 feet, and  $\frac{2703}{10000}$  of a foot, equal to 10 and half.

*Note.* If two sides of a trapezium are parallel, that is, equi-distant, then add them together, and half the sum multiplied by the nearest distance between those two sides, gives the content; or if you measure in the middle between two sides or lines that are of equal length, the answer will be the same.

*Note also,* The painting, plastering, &c. of irregular pieces in the forms of triangles or not, if divided as above, may be measured as before, and brought into yards (if the content is to be so given in) by dividing by 9, as before shewn.

The customary way to measure timber is this: with a small string or cord, take the circumference of the tree (which is done in any place where the buyer and seller can agree) then double this string into 4 parts, and apply it to your rule, and that length is called the girt, or  $\frac{1}{4}$  part of the circumference; and it is also customary to abate one inch of the girt, on account of the bark.

Having got the girt, multiply it by itself, that is, square it, and multiply that product by the length of the tree in feet, and divide by 144, gives the content; or multiply it by the length in inches, and divide by 1728, gives the content.

*Note,* Few persons mind less than  $\frac{1}{2}$  a foot in the length of a tree, except it is very large.

*Quest.* There is a tree 14 inches girt, and 9 feet long, I demand the content? Ans.  $12 \frac{1}{3}$  feet.

First, 14 multiply by 14, is 196, this  $\times$  9, the length = 1764, which divide by 144, gives 12 feet, 36 inches, which is  $\frac{1}{3}$  of 144.

X 2

*Quest,*

232 *Youth's faithful Monitor: Or*

*Quest.* There is a tree 10  $\frac{1}{2}$  inches girt, and 12 feet long, I demand the content? *Ans.* 9  $\frac{1}{2}$  feet. For  $10.5 \times 10.5 = 110.25 \times 12.5 = 1378.125 \div 144 = 9.57$  feet, or 9 feet, 82 inches.

Having the breadth and depth of a piece of timber or stone; to know how much in length of it will make a solid foot; multiply one by the other, and let the product be a divisor to 1728, thus:

$$\begin{array}{r}
 36 \\
 24 \\
 \hline
 144 \\
 72 \\
 864 \quad 1728 \text{ (2 inches in length)} \\
 \underline{1728} \\
 0
 \end{array}$$

And thus you may make a table to serve all breadths and depths, by which much labour may be saved in multiplying and dividing, and yet measure any piece of timber thereby very exactly.

In square timber, you must make the inches squared a divisor to 1728, and the quotient will be the answer in inches at length, that will make a foot solid.

*Example.*

If a piece of timber be 6 inches square, what length of it will make a foot?

$$\begin{array}{r}
 36 \quad 1728 \quad (48 \\
 \underline{144} \\
 288 \\
 \underline{288} \\
 (0)
 \end{array}
 \quad \text{Ans. 48 inches or 4 feet in length.}$$

Here the square of 6 is 36, &c.

*Of tapering Timber.*

Some persons will take but one girt, though a tree be very long and tapering; but this is certainly very wrong.

as it may do injustice to either the buyer or seller. The best way is, to measure such a tree, as if it were two or three distinct trees, by taking two or three several lengths and girts.

Some, indeed, take two girts, one at the great and the other at the small end, and add them together, and take the  $\frac{1}{2}$  of it for a mean girt (as in board measure) but this is a hurt to the buyer, and very erroneous; whereas they should multiply one girt by the other, and extract the square root for a mean girt.

*Quest.* Suppose a tree 20 inches girt at one end, and 40 at the other, and 9 feet long, I demand the content?

By the customary way, the mean girt will be 30 inches, and the content will be 56 feet, 36 inches  $= \frac{1}{4}$  of another foot. But, according to the true way, the mean girt is but 28.28, and the content but 49.98 feet, viz. 49 feet, 14 inches, which is 6 feet 39 inches less than the other, which is a sensible difference in many loads of timber.

*Note.* In some counties 40 feet make a load, and in others 50 feet make a load.

When there are 50 feet to the load, then to cast up the content, at any given price, the rule is, Multiply the content or number of feet, by the price in shillings, and cut off the three first figures from the right to the left-hand: So will the figures towards the left-hand be pounds sterling, and the other will be decimal parts of a £.

#### Example.

*Quest.* Suppose I measured 6 trees, and their content be 548 feet, at 1 l. 10s. per load?

I multiply 548 by 30, and it gives 16440, which I cut off thus, 16|440, and it is l. 16.440 viz. 16 l. 8s. 9d.  $\frac{1}{2}$ .

*N. B.* Stone is measured the same, only observe, 8 inches make 1 foot of stone.

#### Of BRICK WORK.

BRICK work is measured by the square rod, viz. 16 feet  $\frac{1}{2}$  in length, and 16  $\frac{1}{2}$  in breadth, make 272  $\frac{1}{2}$  feet, or 1 square rod; but, for common practice, 272 feet only is sufficient.

234 *Youth's faithful Monitor: Or*

All sorts of brick-work is reduced to the standard of  $\frac{1}{2}$  brick thick, of which I shall give you a further notion by and by.

*Of Work at  $1 \frac{1}{2}$  Brick thick, the Standard.*

Multiply the length by the height in feet, and divide by 272, the quotient gives the square rods, and the remainder, the feet, or parts of a rod.

*Quest.* A gentleman built a brick wall round his garden which was 998 feet long, 9 feet high, and  $1 \frac{1}{2}$  brick thickness, I demand how many rods it contains. *Ans.* 33 rods 6 feet.

Here I multiply 998, the length by 9, the height, and it gives 8982 feet, which I divide by 272, the feet in a rod, and it gives 33 rods, 6 feet. *Ans.*

Suppose it was 1 brick thick, or suppose it was 2, or 3 bricks thick.

Having found the content, at  $1 \frac{1}{2}$  brick thick, as before directed, say thus:

As 3 (the  $\frac{1}{2}$  bricks in the standard measure) is to the content in standard measure, at  $1 \frac{1}{2}$  brick thick, so is the number of half bricks in the wall to the content, at that thickness.

*Quest.* There is a brick wall 998 feet round, and 9 feet high, what is the content at  $2 \frac{1}{2}$  bricks thick?

The content at  $1 \frac{1}{2}$  thick, was found in the last question to be 33 rods, 6 feet, say, therefore,

As 3 to 33,6, so is 5 half bricks, viz. the thickness, at  $2 \frac{1}{2}$  bricks thick to the content, at that thickness, viz. 55 rods 10 feet.

But any thickness may be done at one operation,

For having multiplied the length by the height, divide by any of the following numbers, that are set against the given thickness, and you have the content in rods at once, and the remainder is feet.

*Note,* Though there be decimals in the divisors, you may divide by the whole numbers for common use.

For

For 1 }  $\left\{ \begin{array}{l} 408.3 \\ 272.25 \\ 204.2 \\ 163.3 \\ 136.12 \\ 116.6 \\ 102.1 \\ 90.7 \\ 81.7 \end{array} \right\}$  *Quest.* There is a wall  
 $1\frac{1}{2}$  } Brick thick } 15.5 feet long, and 9.5  
2 } divide by } feet high; what is the  
 $2\frac{1}{2}$  } } content, at  $3\frac{1}{2}$  bricks  
3 } } thick? Answer, 1 rod, 2  
 $3\frac{1}{2}$  } } tenths: For 1 multiply  
4 } } 15.5 by 9.5 = 147.25, which  
 $4\frac{1}{2}$  } } divided by 116.6 the divi-  
5 } } for for  $3\frac{1}{2}$  bricks, gives 1  
rod, 2 tenths. And thus for any thickness, for at  $4\frac{1}{2}$   
thick, it is 1.5 rod, viz  $1\frac{1}{2}$ .

*By the Slip or sliding Rule.*

There is a wall 9 feet high, and 76 feet long, and  $1\frac{1}{2}$  brick thick, I demand the content? Ans. 2 rods 140 feet, or better than  $2\frac{1}{2}$  rods.

Set 272 on the slip to the height 9 above it, then against 76, the length on the slip, is  $2\frac{1}{2}$  or better on the rule.

*A Rule for any Thickness.*

Set any of the former divisors, answering any thickness on the slip, to the height; then against the length is the answer. Thus the same wall at three bricks thick.

Set 136 to 9, then against 76 you have 5 rods, the content at three bricks thick.

*A Table to reduce Brick Work to Standard Measure, i. e. a Brick and a Half.*

Brick			
1	Subtract $\frac{1}{3}$	}	Reduces to a brick and half.
2	Add $\frac{1}{3}$		
3	} Multip. by		
$4\frac{1}{2}$		{ 2 3 4 }	
6			

*Example.*

Suppose a garden wall to be 254 feet round, and 12 feet 7 inches high, and three bricks thick; how many rods doth it contain.

## OF SOLID MEASURE.

**S**olid or cube measure hath been already defined, (as well as superficial measure) some of the figures of which are numbered 6, 7, and 8.

To measure a solid in form of a cube, which hath length breadth and thickness all equal, you must multiply these into themselves; and the last product gives the solidity or content either of wood or stone. A cube hath six sides, and is in shape like a dye.

*Example.*

What is the solidity of a cube whose side is 12 inches? as fig. 6.

12
12
<hr/>
144
12
<hr/>

1728 the solid inches in a foot.

To measure a solid of unequal length, breadth and thickness; multiply the length by the breadth, and that product by the height; the last product will be the solidity.

*Example.*

What is the solidity of a block of marble, whose length is 10 feet, breadth 5  $\frac{3}{4}$  feet, and depth 3  $\frac{1}{2}$  feet?

$$\begin{array}{r}
 5,75 \\
 3,5 \\
 \hline
 2875 \\
 1725 \\
 \hline
 20,125 \\
 10 \\
 \hline
 \end{array}$$

201,250 the solidity.

The cone is measured by finding the superficial inches at the bottom or base thereof; which multiply by one third of the inches in length, and that product is the solid quantity in inches; which inches divide by 1728, and the quotient gives the answer in solid feet.

Example of finding the solidity of the cone decimally, without dividing by 1728.

Let the diameter of the base be 2 feet 6 inches, and the altitude 10 feet 6 inches.

$$\begin{array}{r}
 2,5 \text{ the diameter} \\
 2,5 \\
 \hline
 125 \\
 50 \\
 \hline
 6,25 \text{ the square of the diameter,} \\
 ,7854 \\
 \hline
 2500 \\
 3125 \\
 5000 \\
 4375 \\
 \hline
 4,908750 \text{ the area of the base.} \\
 3,5 \text{ one third of the height.} \\
 \hline
 24543750 \\
 14726250 \\
 \hline
 \end{array}$$

17,1806250 the solidity in feet.

This

## 238 *Youth's faithful Monitor: Or*

This method may serve for tapering timber, or for any other thing of the shape represented in fig. 7.

### *To measure a Pyramid.*

*Rule.* Multiply the area of the base or bottom, by one third of the perpendicular height, and the last product will be the content in solid feet; or one third part of the area at the base, multiplied by the whole altitude, gives the content also.

### *Examples of both Ways.*

Suppose there is given a square pyramid (or figure like a spire steeple, as fig. 8.) the side of whose base is 4 feet and half, and the perpendicular height 18 feet, what is the solid content?

4,5	6,75 $\frac{1}{3}$ of 20, 25 the area at the base
4,5	18 the whole height
<hr/> 225	<hr/> 5400
180	675
<hr/> 20,25	<hr/> 121,50 Answer 121,50 as before
6 $\frac{1}{3}$ of the altitude	
<hr/> 121,50 Answer 121 feet, and $\frac{1}{2}$ or $\frac{1}{2}$	

When one side of the base is longer than the other, as admit one to be 2  $F \frac{1}{2}$ , and the other 1  $F \frac{1}{2}$ ; then multiply the length of the base by the breadth, and that product by one third of the height, as before.

## *OF SURVEYING.*

**L**AND measure is a part of the mathematics, and to survey it true, and in a masterly manner, you should be provided, 1. With a chain called Gunter's chain. 2. A case of instruments. 3. A parallel ruler. 4. A plain table. 5. A platting scale, or protractor. And to make it more compleat, a theodolite.

But for want of these instruments, a common regular field, or little piece of ground may be measured by a chain only

only, or, for want of that, a cord, or rod pole, or any such thing; but this must not be depended on for truth.

*Note, 1.* All land is now generally measured by a chain containing 4 rods or poles, in length (viz. 22 yards) according to a statute made in the 33d. of Edward I. Anno 1305, which says, *That a square acre shall contain 160 rods, viz. 40 rods in length, and 4 rods in breadth, make 160 rods, or 1 acre of ground*

*Note, 2.* The chain is a chain made of iron, containing 100 links, each in length 7.92 inches (or nearly 8 inches) 100 of which is 792 inches, or 22 yards (viz. 4 rods) therefore 1 chain in length, or 10 in breadth, or 10 in length, and 1 in breadth, make an acre.

*Note, 3.* For want of a chain, you may take a cord 22 yards or 4 rods long, or any number of rods long you please, dividing it into halves and quarters, with which you may measure any common field within a trifle of truth, or at least for common satisfaction.

Having provided yourself with a chain, or any convenient line, if the field, or piece of ground be regular, viz. a square, or the opposite sides alike, then measure the length and the breadth in rods or parts, and multiply the length by the breadth, and divide the product by 160, the rods in an acre, you have the content.

*Quest.* There is a field in the form of a long square (called a parallelogram) whose length is 35 rods, and breadth 24 rods, I demand the content in acres? *Ans.* 5 acres, 1 rood.

*First,* I multiply 35, the length, by 24, the breadth, and it gives 840 rods, which I divide by 160, gives 5 acres, and 40 remains, which I multiply by 4 (because 4 rods make 1 acre) and divide again by 160, gives 1 rood.

*Quest.* There is a three-sided or triangular field, as fig. 3. ABC, the side AC is 51.5 rods, and the perpendicular BD is 34 rods, how many acres does it contain? *Ans.*  $5 \frac{1}{2}$  acres nearly.

*Note,* You must first of all measure the side from A to C, called the base, which suppose  $51 \frac{1}{2}$  rods, then measure half way from A to C, and from D measure straight up to the point B, which is called the perpendicular, which suppose to be 34 rods: Now, I told you before, that the base multiplied by  $\frac{1}{2}$ , the perpendicular gives the content; that

is 51.5 multiplied by 17. ( $\frac{1}{2}$  the perpendicular) gives 875.5, which divide by 160, gives 5.47 acres; that is, very near  $5\frac{1}{2}$  acres.

*To measure any four-sided Field, whose Sides are unequal, called a Trapezium. Fig. 4.*

*Quest.* There is a trapezium, or four sided field, or piece of ground, A B C D, whose base A C is 64 rods, and the perpendicular B f is 60, and the other perpendicular D e is 40: I demand the content in acres? *Answ.* 20 acres.

First, To measure this field, go streight cross it from the corner A to the corner C, which here is called the base, and measures 64 rods: Then measure right streight from the point B to f, which is 60 rods, and right streight from D to e, which is 40 rods. This done, the rule is.

Multiply the whole base A C 64 by  $\frac{1}{2}$  B f 60 (viz. 30) and it gives 1920 rods, the content of the triangle A B C: Then again multiply the base A C by  $\frac{1}{2}$  D e 40 (viz. 20) and it gives 1280 rods, the content of the triangle A C D. Add those 2 together, viz. 1920, and 1280 rods, gives 3200 rods, which divide by 160, the rods in an acre, gives 20 for the answer.

If the field has more sides, you may measure it after the same manner, by dividing it into triangles, always remembering to multiply the base by  $\frac{1}{2}$  of every perpendicular that falls upon it.

## Of GAUGING.

**T**HERE is a near sort of kindred and affinity between the art of measuring of timber, and that of gauging or measuring of liquors; for both are performed by cube or solid measure, and therefore not improper closely to follow one another. For as often as there are found 1728 solid or cubic inches in a piece of timber (of what form soever) so many solid feet it is said to contain: So likewise in the art of gauging, so many times as 282 (the solid inches in a beer or ale-gallon) are found in any vessel of such liquor, so many gallons is such a vessel said to hold: and so of wine but in that the divisor alters, it being 231 solid or cubic inches.

And the gallon of dry measure contains  $272 \frac{1}{4}$  cubical inches.

*Note.* Every cubical foot in beer or ale measure, contains 6 gallons and almost a pint.

The same in wine measure is 7 gallons, and almost two quarts.

A cubical foot of dry measure contains 6 gallons, and somewhat above one third of a gallon.

141 inches make 2 quarts of beer or ale; 70 inches  $\frac{1}{2}$  one quart, and 35 inches  $\frac{1}{4}$  a pint.

To find the content of any vessel that hath the form of a cube, that is a figure whose breadth, depth and length are all equal, and is very well represented by the shape of a dye commonly played with, as *fig. 6.*

*Rule.* Multiply the side into itself, and then again that product by the side; which last product, if for beer or ale, divide by 282, the inches in a beer or ale gallon; and for wine, brandy, &c. by 231, the inches contained in a wine gallon.

*Example.*

Suppose a cube whose side is 79 inches, I demand the solid content in beer and wine gallons.

79	282)493039(1748 beer or ale gallons

*To gauge a back or square Tun, as Fig. 10.*

*Example.*

Suppose its length 112 inches, breadth 72 inches, and its depth 48 inches; what is its content in solid inches, and also its contents in beer gallons?

*The Young Man's best Companion.* 243

112 length.	282) 387072 (1372 gallons, Answer.
72 breadth.	282 ...
<hr/> 224	<hr/> 1050
784	846
<hr/> 8064	<hr/> 2047
48 depth.	1974
<hr/> 64512	<hr/> 732
32256	564
<hr/> 387072 solid inches.	<hr/> (168)

To bring these gallons into barrels divide them by 36, the gallons in a barrel of beer, thus:

$$\begin{array}{r}
 36) 1372 \text{ (38} \\
 \underline{108} \phantom{0} \\
 292 \\
 \underline{288} \\
 (4)
 \end{array}$$

Answer, 38 barrels and  $\frac{4}{9}$ , or  $\frac{1}{3}$  of a barrel; and for the remainder 168, it is something above half a gallon.

*How to gage a Copper, round Tub or Cask.*

If it be of equal bigness both at top and bottom, find the cube inches that it contains, and then bring it into gallons as before.

But if it be wider at the top than at the bottom, or the contrary; then take the width or diameter of the tub somewhat above the middle, next to the broadest end, if it be taper; or find the mean diameter thus: Suppose the bung diameter to be 26 inches, and the head diameter of the cask to be 23 inches, the difference between which is 3 inches, two thirds of which make 2 inches; which added to the lesser of the two diameters, make 25 for the mean diameter sought. Having the mean diameter, proceed to find the content in solid inches, thus: First square the mean diameter, multiply that square by 0.7854, and the product will give the content of the liquor at one inch deep, and this multiplied by the length, will give the solid inches in the copper, tub or cask.

Y z

*Example.*

*Example.*

Suppose the mean diameter to be 72 inches, and the length 56 inches.

72	4071,5136
72	56
<hr/>	<hr/>
144	144290816
504	203575680
<hr/>	<hr/>
5184 square.	228004,7616

*How to gauge or tell the Content of any common Cooler, or regular Cask, or Cistern, in Gallons or Bushels.*

I shall give you some short instructions, by which you may tell the content of several things near enough truth, for your own satisfaction: But, to be a practical gauger, you

To are then by  
you ought to understand several branches of the mathematics.

*To tell the Content of a Malt Cistern in Gallons and Bushels.*

*Quest.* There is a cistern 6.5 feet long, 4 feet wide and 3.5 feet deep: I demand its area, and content in gallons and malt bushels?

*Note 1.* Area signifies the superficial content, or content at one inch deep; which multiplied by the depth, gives the content itself.

*Note 2.* That 282 inches make 1 gallon of ale, water, &c. 231 a gallon of wine, and 2150 inches, 1 bushel; which are your divisors for all regular figures.

*Rule.* Multiply the length, 78 inches by the breadth 48, and it gives 3744 inches, which divide by 282, gives 13.276, the area, at 1 inch deep, or divide by 2150, gives 1.741, the area in bushels. The area multiplied by the depth 42 inches, gives 557.592 gallons. The area for malt multiplied by 42, gives 73.122, the content in bushels.

*Note.* If the area be not required, or you do not understand decimals, you may more easily find the content at once, thus: Multiply the length, breadth and depth, in inches together, gives 157248, which divide by 282, gives 557 gallons  $\frac{1}{2}$ , or 157248 divided by 2150, gives 73 bushels  $\frac{1}{10}$  as before.

*To find the Area by the Sliding Rule.*

Set 282 upon B to 48, the breadth on A; then against 78, the length on B, is 13.276, the area in gallons.

For malt. Set 2150 on B to 48 on A; then against 78 the length on B, is 1.741 on A, the area in bushels. And thus for any regular figure.

*To gauge a Tub or Cooler in the Form of a Cylinder, viz. whose Top and Bottom Diameters are equal.*

*Rule.* Square the diameter, viz. multiply it by itself, and this product by the depth, then divide by 359 for beer gallons, 294 for wine, and 2737 (or rather by 2737.47) for malt.

*Quest.* There is a tub 4 feet 2 inches diameter, and 3 feet 4 inches deep: I demand the content in beer, wine and malt? I

I square the diameter 50, which is 2500, and multiply this by the depth, 40 inches, gives 100000; which divide by 359, gives 278 ale gallons; divide by 294, gives 340 wine gallons, and by 2737 only, gives 36.5 malt bushels.

*Note.* If the figure be the form of a triangle, or trapezium, you must proceed to measure them as before directed, and after having multiplied by the depth, divide by 2150 for beer, 231 for wine, 2150 for malt, gives the content.

*Quest.* There is a tub, whose top diameter is 40 inches, bottom 30 inches, and the depth 60 inches; I demand the content in beer, wine and malt?

There are several ways to do this. One is this, multiply the diameters together, and extract the square root for a mean diameter, which is here 34.64. This multiplied by itself, and divided by 359, gives the content in gallons, or by 2737, gives the malt bushels.

*Or more easily thus, though not so true.*

Add the diameters together, and take the  $\frac{1}{2}$  for a mean, is 35. Now  $35 \times 35 = 1225 \times 60 = 73500$ , which divided by 359, gives about 205 gallons; and so for malt, viz. gives 26 bushels  $\frac{8}{10}$ .

*For a Couch of Malt.*

If it be a regular square only, multiply the length breadth and depth together, and divide by 2150, gives the bushels.

If it be a triangle, or trapezium, proceed as before directed, and divide still by 2150.

If the couch be uneven, take the depth at 4 or 5 places, add them all together, and divide by the number of places you took the depth at, for a mean depth.

*Quest.* There is a bed, or couch of malt, in the form of a long square, whose length is 35 feet, breadth 16 feet, and I find the mean depth to be 8.5 inches, viz.  $8\frac{1}{2}$  inches. I demand the contents.

Thus  $420 \text{ inches} \times 192 = 80640 \times 8.5 = 68540$ ; this divided by 2150, gives 318.8 bushels.

*Of Cask Gauging.*

There is a great variety in gauging casks; but the following methods will be near enough truth for all common casks, such as barrels, butts, &c. that are pretty much bulged.

First, Having taken the bung and head diameters, the rule is, To the sum and half the sum of the squares of the bung and head diameters, add  $\frac{1}{2}$  the difference of the said squares: This sum multiply by the length, and divide by 1077 for beer, and 882 for wine gallons.

2 Rule, which is as true and much easier.

To the double square of the bung diameter add the square of the head diameter; then multiply this sum by the length of the cask, and divide by 1077 for beer, or 882 for wine.

*Quest.* There is a cask whose bung diameter is 28 inches, head diameter 25 inches, length 36; I demand the content in ale gallons?

First the square of the bung diameter 28 is 784; which doubled is 1568. Then the square of the head, viz.  $25 \times 25 = 625$ , which added to 1568, is 2193, this  $\times 36$ , the length is 78948, which divided by 1077, gives 73 gallons, 2 pints, for beer; and divided by 882, gives  $89\frac{1}{2}$  gallons wine and brandy.

*Note 1.* If you find the area of the bung, and head diameters, and add twice the arrea of the bung: viz. 2.184 to the area of the head 1.741, it is 6.109, which multiplied by  $\frac{1}{3}$  of the cask's length, viz. 12, gives 73.308 gallons as before.

These methods holding good for most casks, I shall give no more examples.

*Note 2.* If one of the head diameters be larger than the other, and the cask is straight in the sides, like some churns, then find a mean diameter throughout, and proceed as therein directed.

*Of Cross Multiplication.*

There are two methods. 1. by multiplication only.

*Rule* Multiply feet by feet produces feet; multiply feet by inches produces inches, and multiply inches by inches, gives the 12th part of an inch.

*Note*

*Note*, 12 seconds make 1 part, 12 parts make 1 inch, and 12 inches 1 foot.

2. By multiplication and division.

*Rule*. Having placed the smallest sum for the multiplier, multiply the very last place of the multiplicand towards the right-hand by the first place, or name of the multiplier, and carry 1 for every 12, setting down what is over 12 under the part you multiplied, then take the parts of the multiplier as in practice, carrying as before 1 for every 12.

But an example will render it more easy, if I give it both ways.

	feet.	inch.	parts.		feet.	inch.
Multiply	4	3	4	by	3	9
by	3	9				
	12	10				
	3	2	6			
	16	—	6			
	feet.	inch.	parts.			

First, I begin and multiply the top 4 feet, 3 inches, and 4 parts, 3 feet by (carrying one for every 12) saying 3 times 4 is 12 parts, that is 0 and carry 1; then 3 times 3 is 9, and 1 I carried is 10 inches; then 3 times 4 is 12 feet; and then I multiply 4 feet 3 inches, 4 parts, by the lower 9 inches, saying, 9 times 4 is 36, that is 36 seconds, which is 0 and carry 3; then 9 times 3 is 27, and 3 I carried is 30, that is 6 and carry 2; lastly, 9 times 4 is 36, and 2 is 38, which 38 inches is 3 feet 2 inches.

#### *Second Method.*

I first multiply the first or top line as before, and find it as before, 12 : 10 : 0; and now I take the parts as in practice, saying, 6 inches is  $\frac{1}{2}$  of a foot, &c. *See the work.*

feet.

		feet.	inch.	part.
		4	3	4
		3	9	
		<hr/>		
inch.		12	10	—
6		2	1	8
3	$\frac{1}{2}$	1	0	10
	$\frac{1}{2}$	<hr/>		
		16	—	6 as before.

*Quest.* There is a square piece of ground set out upon a heath or common, in order to form a camp for 1000 soldiers, each side containing 60 rods; how many acres does it contain? *Answer,*  $22 \frac{1}{4}$  acres.

For  $60 \times 60 = 3600$ , which divide by  $160 = 22$  acres, 80 rods, or  $22 \frac{1}{4}$  acres. Thus much for Arithmetic.

## OF MONEY.

THE current coin of this nation, is made either of copper, silver or gold. Of copper are made the farthings and halfpence. Of silver, the pennies, two-pennies, threepences, groats, sixpences, shillings, half crowns and crowns: But there is very little silver coined below the sixpence. Of gold is made the quarter guinea, the half guinea, the guinea, and the five guinea piece; besides there are foreign pieces of gold that pass, though with some scruple; as the moidore at 27s. pieces of 36s. each, and others of 3l. 12s. There are also some few ancient pieces of gold of a pale colour, as being alloyed with silver, and therefore may be reckoned the best, and sometimes called angel or crown gold; whereas the old gold or broad pieces, are mostly alloyed with copper, which makes them of a redish colour.

### *Imaginary Money.*

We appropriate several names to money, of which there is no coin; as,

		s.	d.
The pound of	_____	20	0
The mark	_____	13	4
		The	

The noble, or half mark ——— 6 8  
 The angel ——— 10 0

In England accompts are kept in pounds, shillings and pence sterling; and the marks are derived from their names in Latin, viz. *l.* for *librae* or pounds, *s.* for *solidi* or shillings, *d.* for *denarii* or pence, *qr.* for *quadrantes* or farthings, 4 making a penny; and expressed or set down thus,

*l. s. d. qr.*  
 4 16 8 2

but better thus, *l.* 4—16—8  $\frac{1}{2}$ ; the mark for pounds standing before the sum, denominates the first number, and the others are known of course, for after pounds follow shillings, and after shillings succeed pence, &c. When the price of any thing is shillings and pence, it is set down thus:

*s. d.*  
 4 6

or thus, 4/d; and when shillings and pence, and parts of a penny, expressed thus,

*s. d.*  
 4 6  $\frac{1}{2}$

or thus, 4/6  $\frac{1}{2}$ . The latter way by some is accounted the neatest and best method to express parts of a penny, or farthings; thus,

$\frac{1}{4}$  a farthing, or one fourth part of what it follows.

$\frac{1}{2}$  a halfpenny, or one half of what it follows.

$\frac{3}{4}$  three farthings, or 3-4ths or qrs. of what it follows.

And being thus set fraction ways, the under figure shews how many parts the quantity before it is divided into, and the upper figure shews how many of those under parts the fraction stands for; as thus,  $\frac{1}{2}$  of an ell,  $\frac{3}{4}$  of a foot, or 9 inches; and the same of a shilling is 9 pence; of a pound is 15s.

If you are to set down 6 yards and half, write thus, 6  $\frac{1}{2}$  yds.

Nineteen hundred three quarters thus,

19  $\frac{3}{4}$   
 lb.

Sixteen pounds and a quarter thus,

16  $\frac{1}{4}$

or else thus, 16C.  $\frac{1}{4}$  16lb.  $\frac{1}{4}$  5 feet  $\frac{1}{2}$ , 14 days  $\frac{3}{4}$ . Here the name is put between the whole number and the fraction, which I think is the plainer and better way: For example, 6  $\frac{1}{2}$  hhd. may through ignorance or wilfulness, be read 6 half hhd. as well as 6 hhds. and half.

A Table exhibiting at one view the value of any number of Portugal pieces of gold in English pounds and shills.

*Example.*

First, at 5d. 3q. the pound, what is the great hundred? Look in the table for 5d. 3q. in the first column, and against it in the second, you shall find 2l. 13s. 8d. and so much will 112 pound cost. Again, if a hundred weight cost 4l. 8s. 8d. find 4l. 8s. 8d. and against it, in the column towards the left-hand, you will find it 9d. 2q. and so much it is by the pound.

*Note,* For every farthing that one pound doth cost, reckon two shillings and four-pence, and that is the price of the great hundred.

*Use of the foregoing* INTEREST TABLES.

These Tables will, with a very little trouble, answer the purposes of the best tables of Interest contained in entire volumes on that subject alone, of higher price than this whole book. The Rates of Interest are expressed at the head of each table, viz. 3,  $3\frac{1}{2}$ , 4 and 5  $\text{p}^{\text{c}}$  Cent. which Rates suit both the present Interest of the public Funds, and private Obligations of MORTGAGES, BONDS, PROMISSORY NOTES, BILLS of EXCHANGE, or any other Security or Deposit on which any of the Rates of Interest above-mentioned are chargeable, or allowed by law, custom or agreement, between the Borrower and the Lender.

R U L E.

Multiply the Principal by the number of Days, and the product arising collect from the Table of any of the Rates of Interest, as if it was the Principal itself, and the Interest of the sum proposed is obtained for that time, care being taken to use that Table suited to the Interest of the Security. These Examples will be sufficient.

E X A M P L E S.

What is the Interest due on a private Bond for 150*l.* for 106 Days at 5  $\text{p}^{\text{c}}$  Cent? As  $\text{p}^{\text{c}}$  Rule:

150 *l.* Principal.  
106 Days.

---

900  
150

---

15900 Product, or new Principal, which

collected from the Table of 5  $\text{p}^{\text{c}}$  Cent. will be thus:

l.		l.	s.	d.	q.
10,000	—	1	7	4	3
5,000	—	0	13	8	2
900	—	0	2	5	1
<hr/>		<hr/>			
15,900		2	3	6	2
<hr/>		<hr/>			
		Interest.			

When

When there are shillings and pence in the principal, the aliquot parts of the number of days must be added to the product of the number of days into the entire pounds in the principal; or reduce the shillings and pence into a decimal, which may be done mentally, and multiply the mixt number by the number of days, and either way collect the product from the proper table, and the interest is obtained.

## E X A M P L E.

What is the interest of 75*l.* 15*s.* for 50 days at 5  $\frac{1}{2}$  cent?

	<i>l.</i>	<i>s.</i>	
	75	15	principal.
	50		days.
	<hr/>		
	3750		
$\frac{1}{2}$ for 10 <i>s.</i>	25		
$\frac{1}{2}$ for 5 <i>s.</i>	12 6		
	<hr/>		
	3787.6		

which collect from the table of 5 per cent. and you have

	<i>l.</i>	<i>s.</i>	<i>d.</i>	<i>q.</i>	
3000	0	8	2	3	
700	0	1	11	0	
80	0	0	2	3	
7	0	0	0	1	
	<hr/>				
3787	0	10	4	3	interest.

	<i>l.</i>
The same by decimals	75.75
.75 being the decimal for 15 <i>s.</i>	50
	<hr/>
	3787.50

It is needless to collect these numbers from the table, as they are the same with them above by aliquot parts; and at all times, if there are pence in the principal, they may be rejected as not necessary to be brought into the computation.

*Shewing the Nature and Use of Astronomy and Geography*

**B**Y the globes are here meant two artificial spherical bodies, whose convex part is supported, to give a true and exact representation of the earth and heavens, as visible by observation, and therefore are called the celestial and terrestrial globes.

The celestial globe has the images of the several constellations and stars drawn upon its surface, with their magnitudes expressed, and their just and due position, &c. represented according to their proper situation in the heavens.

The terrestrial or artificial terraqueous globe has the whole surface of the earth and sea delineated on its convexity, in their natural form, order and situation. It is made spherical, to give a true resemblance in figure between it and the natural globe of the earth, which in this case, may be very well taken as such.

For the better understanding these globes, and distinguishing all their exterior parts, with the various operations to be performed by them, they are to be conceived, not barely as spherical bodies, but as such surrounded with many imaginary circumferences of great circles, and their parallels, or small circles; and also having several remarkable points and right-lines.

*Of the Circles of the Sphere, and their Poles.*

By great circles are meant those that divide the globe into two equal parts;

And by small circles, those that divide it into two unequal parts; and are generally denominated by their being parallel to some great circle.

Every great circle has its poles and axis.

A point on the surface of the globe, every-where equally distant from the circumference of the great circle, is called the pole of that circle; and a right line passing through the poles of any circle, is called an axis, and is therefore perpendicular to the plane of that circle.

The axis of the world, or of the natural globe, is an imaginary right line passing through its centre; and upon which it is supposed to turn round. And in the artificial globe, it is not an imaginary line, but that on which the globe really turns.

*The*

The two extrem points of the axis of the world, are called the poles of the world; one of which is termed the north or arctic, and the other the south or antarctic pole.

The circles common to both globes are these eight,

Four great circles, viz.	{	Horizon
		Equator
		Meridian
		Ecliptic.
Four lesser circles,	{	Two tropics,
		Two polar circles.

But several other circles are drawn, and innumerable may be conceived.

#### *Of the Horizon.*

That great circle 90 deg. distant from the zenith and nadir, which divides the globe into two parts, an upper and lower, in respect to us, is called the horizon, and is of two kinds, viz. rational and sensible.

The rational, true or astronomic horizon, divides the globe into two equal parts, called the upper and lower hemispheres.

Its poles are call'd the zenith, which is the point directly over our heads; and nadir, which is the point under our feet, or diametrically opposite the zenith.

Astronomic calculations of the rising or setting of the sun, moon and stars, respects the rational horizon, and by this circle the days and night are determined; for while the sun is above, it is day, when under, night.

The true horizon is represented on the globe, by the upper plane of the broad wooden frame thereof, upon which are inscribed several circles. As

The first or innermost, has the number of the degrees of the twelve signs of the zodiac, 30 degrees to each sign.

The second, has the names, marks and figures of those signs.

The third, has the calendar with the days of the month.

The fourth or outermost circle, has the points of the nautical compass.

But some globes have the kalender on the outside.

The sensible or apparent horizon is the extremity of the earth, that bounds our sight, which for the most part is uneven; and at sea is of greater or lesser extent, as the eye is higher or lower.

These two horizons, when produced to the heavens, may, without any sensible errors, be supposed to coincide, the distance between them, or the earth's semidiameter, vanishing when compared with such distance.

Since the earth moves round its axis, from west to east, it is plain, a spectator upon its surface, together with his horizon, must move the same way; consequently these celestial bodies towards the east, that were before inconspicuous, will become visible, the horizon being depressed below them; and these towards the west, that were before in view, will become invisible, the horizon being elevated above them. And hence arises the apparent motion of all the heavenly bodies, by which they appear to describe circles round the poles, parallel to the celestial equator, which are greater or less, according as they are more or less distant from the nearest poles.

Though the rising and setting of the stars respect the rational horizon, yet by reason of their vast distance, it holds true of the sensible, which is more than 4000 miles above it.

*Of Circles parallel to the Horizon.*

Circles parallel to the horizon, passing through each point of a great circle drawn through the zenith and nadir, are called almicanthers, or parallels of altitude.

That at 18 deg. below the horizon, is called the crepusculum circle; for when the sun is about 18 degrees beneath the horizon, the morning twilight begins, and the evening twilight ends.

*Of the Ecliptic and Zodiac.*

That great circle, which the sun is supposed to describe in its proper motion, is called the ecliptic, or the sun's orbit.

For the sun is here supposed to have two motions:

Adiurnal motion from east to west about the poles of the world, in circles parallel to the equinoctial in 24 hours.

6  
234 *Youth's faithful Monitor: Or*

A proper motion from west, obliquely to east, in the ecliptic, in one natural or tropical year, *i. e.* in 365 days 5 hours, 49 minutes, 4 seconds and  $\frac{1}{2}$ .

The better to distinguish these motions, conceive a worm creeping slowly in the ecliptic, while the globe is turned once round the other way; hereby the sun may be said to describe each day a parallel to the equinoctial (tho' properly it is a spiral line) and yet is never out of the ecliptic.

The planets also, besides a diurnal motion from east to west, have a proper motion in their orbits from west to east.

		years.	days.	hours.
Saturn	} Finishes its course in	30	0	0
Jupiter		12	0	0
Mars		1	315	0
Venus		0	224	18
Mercury		0	88	0
Moon		0	27	8

The orbit of each planet cuts the ecliptic in two opposite points called nodes; and the orbit of Venus is so oblique to the ecliptic, that she may be about 8 or 9 degrees distant from it.

Hence the zone, including the ways of the planets, or the zodiac, is reckoned to be about 8 degrees broad on each side of the ecliptic.

The ecliptic is divided into 12 equal parts called signs, of 30 degrees each, whose names and characters are these, viz.

$\gamma$	$\tau$	$\Pi$	$\text{♋}$	$\Omega$	$\text{♍}$
Aries,	Taurus,	Gemini,	Cancer,	Leo,	Virgo,
$\text{♎}$	$\text{♏}$	$\text{♐}$	$\text{♑}$	$\text{♒}$	$\text{♓}$
Libra,	Scorpio,	Sagittarius,	Capricorn,	Aquarius,	Pisces.

The equinoctial cuts the ecliptic on the opposite points of Aries and Libra (their planes making an angle of 23 degrees 29 minutes) and these points are called the equinoctial points.

When the sun is at the equinoxes, the days alter much; for here the ecliptic is most oblique to the equator.

The tropics touch the ecliptic in the opposite points of Cancer and Capricorn, which therefore are called the solstitial points: When the sun is at the solstices, the days alter

alter but little, for there the ecliptic is almost parallel to the equator.

The fixed stars have likewise a diurnal motion from east to west, and a proper motion from west to east, in circles parallel to the ecliptic; and therefore equi distant from its poles, about 50 seconds in the year; and in about 25920 years, will make an intire revolution, as is easily computed, by comparing antient observations with those made of late: And this period is called the platonic year.

From this motion it is that the constellations of the zodiac, have left the signs to which they gave name.

*Of the Equator or Equinoctial.*

The great circle of the globe, whose poles are those of the world, is called the equator or equinoctial.

It divides the globe into two equal parts, called the northern and southern hemispheres.

The circumference of this great circle passes through the east and west points of the horizon; therefore the stars which are under the equinoctial, always rise due east and set due west: And the sun, when 'tis said to come to this circle, makes the days and nights every where equal; for then only it is said to rise and set due east and west.

The equinoctial, equator or what seamen call the line, is supposed to be divided into 360 equal parts, called degrees. And a natural day is measured by a revolution of the equinoctial, that is 360 degrees revolve in 24 hours, therefore,

$$\left. \begin{array}{l} 24^h = 15 \text{ degrees} \\ \quad 1 \text{ degree} \\ \quad 15 \text{ mins.} \\ \quad 1 \text{ min.} \end{array} \right\} \text{ of the equator in } \left\{ \begin{array}{l} 1 \text{ hour} \\ 4 \text{ min.} \\ 1 \text{ min.} \\ 4 \text{ sec.} \end{array} \right\} \text{ of time.}$$

Which in astronomy is to be noted for the reducing of degrees, minutes, &c. into time, and the contrary.

*Of Circles parallel to the Equator.*

Circles parallel to the equator, passing thro' each point of a great circle drawn through the poles of the world, are with respect to the earth, called parallels of latitude; But

A a

with

with respect to the stars and planets they are called parallels of declination; and the extreme parallels of the sun's declination, or those at 23 deg. and 29 min. distant from the equator, are called the tropics of cancer and capricorn.

Those parallels to the equator, at 23 deg. and 29 min. distant from its poles, northern or southern, are called polar circles, *viz.* arctic and antarctic.

### *Of the Meridian.*

A great circle passing through the poles of the world, the zenith and nadir, is called a meridian; which therefore cuts the equinoctial at right angles, and divides the globe into two equal parts, called the eastern and western hemispheres, and its poles are the east and west points of the horizon. Meridians are also called circles of longitude on the terrestrial globe, and sometimes circles of declination.

But on the celestial globe those are circles of longitude which pass through the poles of the ecliptic, and through each degree thereof.

These two meridians which pass, the one through the beginning of Aries and Libra, the other through the beginning of Cancer and Capricorn, are called the equinoctial and solstitial colures. Which therefore cut one another at right angles, and divide the ecliptic into four equal parts called cardinal points.

Those meridians which are drawn through every 15th degree of the equinoctial, are called hour circles.

The first meridian is that from whence the longitude of places is reckoned. Ptolemy placed the first meridian one degree beyond the Fortunate or Canary islands. After the discovery of America it was fixed in St. Nicholas, one of the Cape de Verd islands: Hondijus placed it at St. Jago: Mercator at Corva, one of the western isles; the Dutch reckon from the Meridian of Teneriff: The French from a meridian passing over the middle of Fero, the westernmost of all the Canary Isles.

But it is abundantly sufficient for all purposes, if the distance or difference of meridians, *i. e.* the arc of the equator intercepted between them, be known, which will or should be found the same in all authors; and therefore every astronomer, calculator of tables, and geographer,

make

makes his own meridian the first; and for that reason, we reckon the longitude from the meridian of London.

*Of vertical or azimuthal Circles.*

Great circles passing through the vertex or zenith, nadir and the several points of the horizon, are called vertical or azimuthal circles.

That which passes through the east and west points of the horizon, is called the prime vertical: And the vertical circle which passes through the poles of the ecliptic, and consequently cuts the ecliptic at right angles in the monageſim degree, or in the 90th degree from the horizon, is called the Nonageſim circle.

*Explication of ſome Words relating to the Sphere.*

1. The altitude of any point in the heavens, is an arc of a vertical circle, intercepted between that point and the horizon.
2. The declination of any point in the heavens, is an arc of the meridian, intercepted between that point and the equinoctial.
3. The right aſcenſion of any point, is an arc of the equinoctial, intercepted between the beginning of Aries and the meridian, paſſing through that point; or is the angle made by the equinoctial colure and the meridian of that point.
4. The oblique aſcenſion, or deſcenſion, is an arc of the equinoctial, intercepted between the beginning of Aries, and that part of the equinoctial which riſes or ſets with that point in an oblique ſphere.
5. The aſcenſional difference, is the difference between the right and oblique aſcenſion or deſcenſion; or that arc of the equator intercepted between the points of right and oblique aſcenſion; or it is the difference between a ſemi-diurnal arc, and 90 degrees, or 6 hours; therefore if the ſun have North or South declination, its accenſional difference is the time of its riſing before or after the hour of fix.
6. The azimuth is an arc of the horizon, intercepted between a vertical circle paſſing thro' any point above the horizon and the meridian; or is the angle of the zenith,

made: by a verticle circle passing through the given point and the meridian.

The amplitude, is an arc of the horizon intercepted between any point at its rising or setting, and the east or west points of the horizon; or is the angle made by a verticle circle passing through any point at its rising or setting, and the prime vertical.

8. The longitude of any point in the heavens, is an arc of the ecliptic intercepted between a circle of longitude passing through that point and the equinoctial point Aries.

By the place of a star, is meant, that point of the ecliptic, over which runs a circle of longitude passing through that star. The longitude of the sun, is an arc of the ecliptic intercepted between the sun, and the equinoctial point Aries. By the place of the sun is meant that sign, degree or minute, &c. of the ecliptic, in which the sun is at any time.

9. The latitude of any point in the heavens, is an arc of a circle of longitude passing through that point, intercepted between it and the ecliptic.

*Of the poetical Rising and Setting of the Stars.*

That star which rises or sets when the sun rises, is said to rise and set cosmically.

And that star which rises or sets when the sun sets, is said to rise or set acronically.

A star is said to rise heliacally, when first it emerges out of the sun's beams, which hid it before.

And a star is said to set heliacally, when it is first immerged or hid in the sun's beams.

The fixed stars, as also Saturn, Jupiter and Mars, rise heliacally in the morning: but the moon rises heliacally in the evening; for the sun is swifter than the superior planets, but slower than the moon.

The depression of the sun under the horizon, when a star rises or sets heliacally, is called the arc of vision; and according to the antients, this arc for stars of the 1st, 2d, 3d, 4th, 5th, &c. magnitudes, is  $12^{\circ}$ ,  $13^{\circ}$ ,  $14^{\circ}$ ,  $15^{\circ}$ ,  $16^{\circ}$ ,  $17^{\circ}$ , and at  $18^{\circ}$ , depression, all the stars appear: but it is known, that a star may be seen, when the sun has a much less depression than assigned by the antients. Jupiter and Venus, when they are brightest, may be seen by day.

*Of the various Positions of the Globe or Sphere.*

I. Of the right position.

That position of the sphere where the equator is perpendicular to the horizon, is called the right position.

1. Here both poles are in the horizon.
2. All the stars do rise and set.
3. All the nocturnal arcs are equal to their diurnal, and therefore a perpetual equality of day and night.
4. The twilight is here shortest; because the sun ascends right to the horizon.

II. Of the oblique position.

That position of the sphere, when the equator is oblique to the horizon, is called the oblique position.

1. Here when the sun is in the equator, it makes the days and nights every where equal.
2. The greater the elevation of the pole is, the longer the summer days are, and the shorter the winter: So that under the polar circles, at the solstices, it is all day or all night.
3. The twilight is so much the longer as the pole is higher; so that in the North of Scotland, about the summer solstice, the twilight is sufficient to read by at midnight.

III. Of the parallel position.

That position of the sphere, where the equator is parallel to the horizon, is called the parallel position.

1. Here the poles of the equator are in the zenith and nadir.
2. The stars and planets in their diurnal motion, describe circumferences parallel to the horizon.
3. The sun is half a year above, and half a year under the horizon: for the horizon bisects the ecliptic.
4. Here the same hemisphere of fixed stars is always above the horizon; and each planet during half its period viz. Saturn 15 years, Jupiter 6, Mars 1, &c.

But the polar inhabitants (if any) are not in darkness all the time of the sun's absence, for the moon, while brightest, viz. from the first quarter to the last, does not set.

And the twilight lasts while the sun has less than 18 degrees declination; so that those under the North-pole (for instance) are without twilight, only from the beginning of November till the middle of January.

Also because of the refraction in such thick air, the sun appears sooner, and goes off later by several days than else it would, as has been found by experience.

*The Division of the Earth into Zones.*

The two tropics and the two polar circles, divide the surface of the earth into five bands, called the terrestrial zones, which have their names from the quality of the temperature which their situation is subject to, viz.

Two temperate zones, comprehended betwixt the tropics and the polar circles.

Two frigid zones, comprehended within the polar circles.

One torrid zone, comprehended between the two tropics.

*The Division of the Earth, by the Diversity of Shadew.*

The inhabitants of the frigid zone are called Perisciens; because in the longest day their shadow goes round about them.

The inhabitants of the torrid zone are called Amphisciens; because their noon shadow is cast different ways, according as the sun is to be northward or southward of their zenith. But when the sun is in their zenith, they are called Ascians.

The inhabitants of the temperate zone are called Heteroscians, because their noon shadow is cast but one way.

But those that live under the tropics, are called Ascians Heteroscians.

*The Division of the Earth by Situation.*

Those who live under the same points of equal and contrary parallels, are called Antœciens: Their seasons of the year are contrary; the days of the one are equal to the nights of the other; the hour of the day and night is the same: and only when the sun is in the equinoctial, it rises with the one when it rises with the other.

Those

Those who live under opposite points of the same parallel, are called Perioeciens; they have the same seasons of the year, the same length of days and nights. The one's noon is the other's midnight: and only when the sun is in the equinoctial, it rises with the one, when it sets with the other.

Those who live under opposite points of equal and contrary parallels, are called Antipodes: These have contrary times of the year and day; the one's longest day or night, is the other's shortest. The sun always rises with the one, when it sets with the other.

*The Division of the Earth by Longitude and Latitude.*

That the different places on the earth might be the better distinguished, their situation may be compared, either

1. By how much any place is to the eastward or westward of some given meridian, reckoning on the equator; and the distance is called the longitude of that place.
2. By how much any place is to the northward or southward of the equator, reckoning on the meridian; and the distance is called the latitude of that place; therefore

The longitude of any point on the earth, is an arc of the equator, intercepted between a meridian passing through that point and the first meridian.

The latitude of any point on the earth, is an arc of a meridian, passing through that point, and intercepted between it and the equator.

*The Division of the Earth by Climates.*

A tract of the surface of the earth, included between two parallels to the equator, is such, that the longest day of the lesser parallel, exceeds that of the greater by half an hour, is called a climate.

These climates are narrower the farther they are from the equator; therefore, supposing the equator the beginning of the first climate, the polar circle will be the end of the 24th climate; for afterwards the longest day increases not by half hours, but by days and months. The following table of the climates shews the length of the longest days, and the latitude at the end of each climate, together with the breadth thereof; so that having the climate  
given

272 *Youtb's faithful Monitor : Or*

given, the latitude is found ; or having the latitude given, the climate and longest day are found.

A Table, *shewing the Latitude of those Places, where the longest Day makes entire Months.*

Length of days. Months.	Latitudes. Deg. Min.

*The Division of the Earth into Parts, right and left.*

For the understanding of authors, wherein any mention is made of the right and left parts of the world, since some call the east the right-hand parts, some the west, some the north, and others the south, 'tis to be noted, that,

The geographers who look to the north, reckon the east the right, and the west the left-hand part of the world.

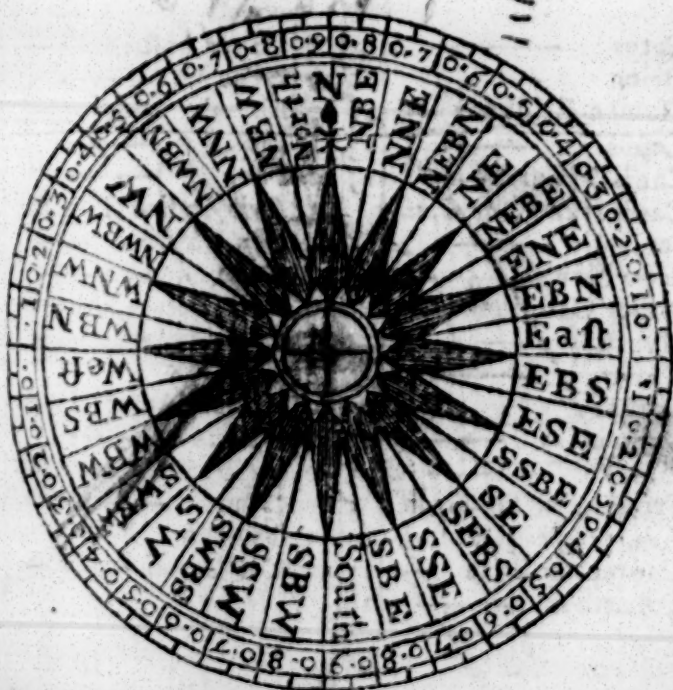

The northern astronomers regard the south, and therefore reckon the west the right, and the east the left-hand part of the world.

The divines who regard the east, have the south to the right, and the north to the left-hand.

The poets who regard the west, reckon the north the right, and the south the left-hand part of the world.

But for the clearer understanding the points, I have here given you

*A PLAN of the COMPASS.*

Which is a representation of the horizon on a circular piece of paper called a card, which being properly fixed to

# 274 *Youth's faithful Monitor : Or*

to a piece of steel called the needle, is so placed as to turn freely round a pin that supports it, and will shew the position of the meridian, and other points.

*Note,* The letters SBE, SSE, SEBS, are to be read, South by East, South South East, and South East by South.

## *Of the Constellations.*

As geographers, for the readier distinction of places, divide the Surface of the earth into kingdoms and provinces, so likewise astronomers, that they might the better know the fixed stars, and give them names, have divided them into constellations or asterisms, as in the following tables :

The Southern Constellations are 32, *viz.*

	Stars		Stars
1 Cetus	21	18 Pisces Austrinus	13
2 Orion	62	19 Grus	13
3 Flumen Eridanus	42	20 Phoenix	15
4 Lepus	13	21 Indus	12
5 Canis Major	15	22 Pavo	23
6 Canis Minor, or Canicula	23	Avis Indica Toucan	11
7 Argo Navis	5	24 Apus Musca	4
8 Rober Carolinum	68	25 Chamelion	10
9 Hydra	11	26 Triangulum Australe	5
10 Crater	24	27 Pisces volans	7
11 Corvus	8	28 Derado	7
12 Centaurius	7	29 Apous Anser Ameri-	
13 Lupus	40	canus	10
14 Crosero, or the crossier	25	30 Hydrus Serpens Aud-	
15 Ara, or the Altar	5	rina	21
16 Corona Austrina	10	31 Toucan	8
17 Columbus	17	32 Cor Caroli Regis	1
	10		

In all 543

The

# The Young Man's best Companion. 275

The Northern Constellations are 23, viz.

	Stars		Stars
1 Urfa Major	20	12 Auriga	27
2 Urfa Minor	55	13 Serpentarius	38
3 Draca	32	14 Serpens	13
4 Cepheus	11	15 Sagitta	8
5 Bootes	28	16 Aquilla	12
6 Corona Borealis	8	17 Antionius	7
7 Hercules	28	18 Delphinus	10
8 Lyra	11	19 Equinicus	4
9 Olon aut Cygnus	27	20 Pegasus	23
10 Cossiopea	45	21 Andromede	23
11 Perseus and Caput		22 Triangulum	4
Medusa	33	23 Coma Berenices	11

In all 478

The Zodiac Constellations are 12, viz.

	Stars		Stars
1 Aries	21	7 Libra	18
2 Taurus	49	8 Scorpion	26
3 Gemini	20	9 Sagitarius	28
4 Cancer	15	10 Capricornus	29
5 Leo	40	11 Aquarius	41
6 Virgo	39	12 Pisces	36

In all 371

The southern constellation called Cor Caroli Regis, was added by Sir Charles Scarborough, it being one star in a crowned heart, lying between Urfa Major and Coma Berenices; so that the constellations are in all 67, containing 1392 stars, besides many that are unformed, which are distinguished into six degrees of magnitude or bigness. The biggest and brightest are called stars of the first magnitude. Those next inferior in bigness and brightness, are stars of the second magnitude, &c. and so on unto stars of the sixth magnitude.

Of

*Of the Natural and Political Divisions of the Earth.*

THE terraqueous globe, or globe of the earth and water is divided, by nature, into continents, islands, peninsulas, isthmus's, mountains, promontories or capes, hills and valleys, oceans, seas, lakes, gulphs or bays, straits, ports or harbours and river's, rocks, shelves, banks, marshes and bogs.

A continent, called sometimes the main land, is a large tract of land containing several contiguous countries, empires, kingdoms or states.

An island, is a piece of land wholly surrounded by the ocean, sea, or water, and so divided from the continent.

A peninsula, (that is to say, *almost an island*) is a piece of land encompassed by water, except on one side, where it is joined to the continent or other land.

An isthmus, is that neck or narrow piece of land that joins a peninsula to the continent.

A mountain, is a part of the earth which is considerably higher or more elevated than other lands near it.

A promontary, is a mountain running out into the sea, the extremity of which is called a Cape, or Head-land.

A hill, is a lesser kind of mountain; and a valley is that land which is situate at the bottom of a mountain or hill, or between two or more such.

The ocean, is a vast body of salt water which separates some of the continents, and washes their borders on shores.

A sea, is a branch of the ocean flowing between some parts of the continents, or separating islands from them.

A lake, is a body of waters every where surrounded by the land.

A gulph or bay, is a part of the ocean or sea contained between two shores, and is encompassed by the land except on one side, where it communicates with the other waters.

A strait, is a narrow passage whereby seas, gulphs, and bays communicate with the ocean, or with one another.

A port or harbour, is a part of the ocean or sea so inclosed by the land, that ships may ride in safety therein.

A river, is a running water descending in a narrow channel from the mountains, or other high lands, and emptying itself into some ocean, sea or lake.

Rocks, are great stones, shelves and banks, are eminences consisting of stones, sands, or other matter which obstruct the passage of ships at sea, and often prove fatal to those who do not keep clear of them.

Marshes, are lands lying low, which are liable to be overflowed by the sea or rivers; and bogs are mixtures of land and water, over or among which it is dangerous to attempt a passage.

By the political divisions of the earth, are meant those established by men, as empires, kingdoms, provinces, countries, monarchies, republics, principalities, dukedoms, diocesses, parishes, cities, towns, villages, &c. But as it is more material for our British reader to be acquainted with his own country, than entertained with an imperfect account of others, I shall begin with giving a description of the market-towns through England and Wales.

## OF ENGLAND.

**T**HE kingdom of England lies on the south of Scotland, and north of France, from which it is divided by the channel, of a triangular form, incompass'd on three sides with sea. In length from north to south, about 360 miles, and in breadth from east to West about 300, containing about 27 millions of acres.

The inhabitants are mostly of the reformed religion, taught here in its purity; their language is a branch of the Teutonic, chiefly compos'd of old Saxon, Latin, and French. Their chief commodities are corn, cattle, tin, copper, lead, iron, timber, coals, abundance of wool, fluffs, linen, hides, tallow, butter, cheese, beer, &c.

The rivers of principal note are, 1. Thames, 2. Severn, 3. Ouse, 4. the Medway, 5. the Trent, 6. the Humber, which last is rather an arm of the sea, into which several river empty themselves.

Its mountains of greatest account are three, to wit, Ingleborough, Pendle, and Pennegent.

Of Archbishopricks 2. Bishopricks 20. And universities 2, namely, Oxford and Cambridge.

An Account of the several Counties of *England* and *Wales*, with their Produce, Market-Towns, and Market-Days, &c. and Days on which the Fairs are held.

Note, *m.* stands for *Monday*, *tu.* for *Tuesday*, *w.* for *Wednesday*, *th.* for *Thursday*, *f.* for *Friday*, *s.* for *Saturday*, being the Market-days. The days on which the Fairs are held, are distinguished by being in Roman Characters, and the Distance of Miles from LONDON is between ( ).

### BERKSHIRE

IS supposed to contain about 527,000 acres, is 120 miles in circumference, hath plenty of corn, cattle, wool and wood, (especially oak) and is accommodated with water carriage, by the very fine rivers of Thames and Kennet,

*And hath these Market Towns and Fairs, viz.*

## The Principality of W A L E S.

**W**ALES was originally independant on England, but it was incorporated with it, in the reign of king Henry the VII. This country is very mountainous and barren, except in the vallies and intervals, where it yields plenty of grass and corn. The situation is westward, bordering on the Irish sea; the air bleak and sharp, but wholesome; the cattle are numerous, but small; on the hills there are goats in abundance. This country is divided into north and south, *viz.*

## N O R T H   W A L E S

Contains Anglesey, Carnarvonshire, Denbighshire, Flintshire, Merionethshire, and Montgomeryshire.

## A N G L E S E Y

Is an island in the north-west part of the country, about 80 miles in compass, and contains about 200,000 acres.

Rhayador, *w.* aug. 6, 27, sep. 26 ( )

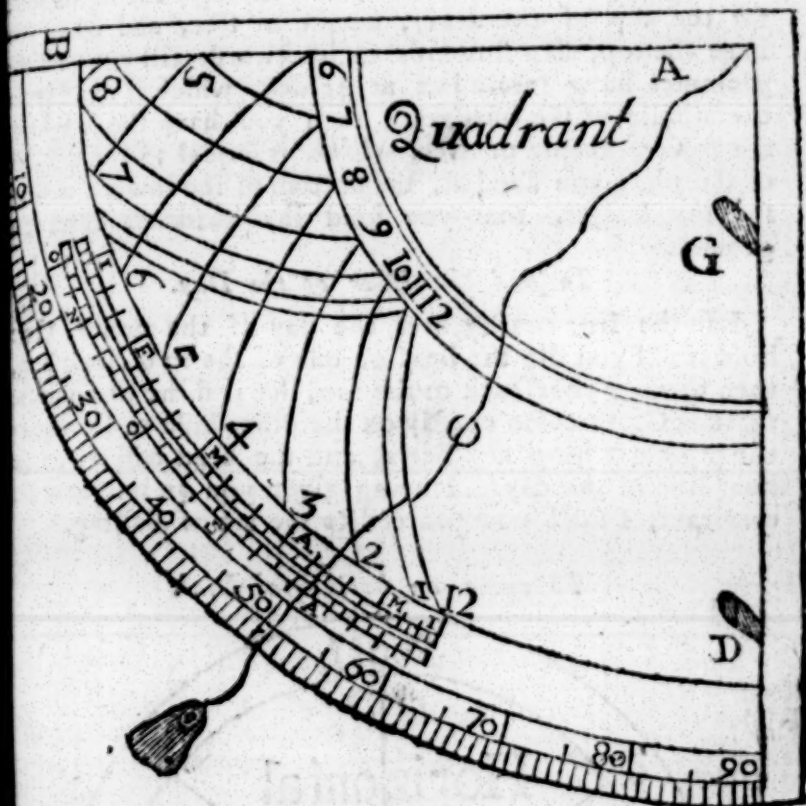

*Note,* The reader is desired to take notice, that where he meets with ( ) not filled up, that the distance of miles from London were never yet ascertained for a certainty.

Having gone thro' the market towns of England and Wales, with their market days, fair days, and distance of miles from London, with the utmost care and circumspection, I need not recommend this useful part of the book to my readers, whose end it may serve, as I presume it will sufficiently answer for itself. My plan has differed greatly from my former Edition, for now *All* the market towns, &c. are here inserted, that the reader cannot miss of finding the whole of them, each under their distinct counties.

Before

Before I proceed to dialling I shall shew you the use of the instrument called a **QUADRANT**, with the description as here drawn.

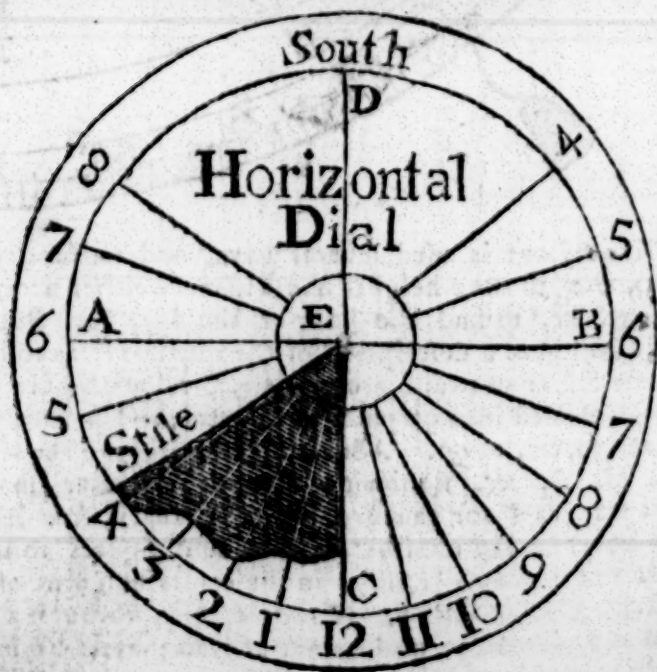

This quadrant is used several ways, and on sundry accounts, *viz.* to take heights and distances either accessible or inaccessible, to find the hour of the day, &c. But first of all I shall give a description of the quadrant, as follows, *viz.* the first or outward arc (being the fourth part of a circle) is divided into 90 parts or degrees, and figured from 10, 20, 30, &c. to 90. Above those figures are the letters I, F, M, A, &c. signifying the 12 calendar months of the year, as I for January, F for February, &c. Above those letters for the months are lines and figures to know the hour of the day. Lastly, in the centre or point of the quadrant, *viz.* at A is fixed a line of silk, through a hole at the end thereof is a plummet of lead; and also in the middle thereof is a small bead. I now come to its use

Suppose you would know the height of a tower, steeple or tree; hold up the quadrant, and through the sights look for the top of the tower, steeple or tree, and when you have the top, step forwards or backwards till you find the plummet hang freely just at 45 deg. which is exactly in the middle of the quadrant; then you have the height of the tower, steeple or tree, which is equal to the distance of the place you stand at, the bottom of the tower; adding for the height, that you hold the quadrant from the ground.

*To find the Hour of the Day.*

Lay the line exactly over the day of the month, there hold it till you slip the bead on one of the 12 o'clock lines, then turning your back to the sun, let it shine through the sight at G, to come exactly on the other hole at D, letting the plummet hang at liberty, and the bead will rest on the hour line of the day. Having given you an insight of the quadrant, I shall now proceed to the art of dialling.

*To make an horizontal Dial.*

**F**IRST draw a line with a ruler, and the point of the compasses, as A B; then cross it at right angles with another line, as the line C D, which is the meridian, or 12 o'clock line, and the line A B the 6 o'clock line; then opening the compasses, place one foot at the beginning of the degrees, or the arc edge of the quadrant, and extend the other foot to sixty degrees, or you may take it from the line of chords in the plain scale, with that extent, set one foot in the centre of the dial at E, where the two first lines cross one another, and draw the circle ABCD.

Next, having the 12 o'clock line E C, to know what distance must be set off from it for 1 o'clock, and 11 o'clock being all one, be directed by the following small table, *viz.*

52°		Lat.
D.	M.	Hours.
11	: 55	1 — 11
24	: 26	2 — 10
38	: 13	3 — 9
53	: 44	4 — 8
71	: 9	5 — 7

In the first column against 1 hour and 11, you find 11 degrees and 55 minutes, which take off the edge of the quadrant, by setting one foot of the compass at the beginning of the divisions under B, and the other foot to 11 degrees, 55 minutes: The compasses so opened, set one foot in the circle at the bottom of the twelve o'clock line, and with the other foot of the compasses, make a mark in the circle both towards A and B, and from those two marks draw lines towards the center, which you may afterwards go over with ink. Then to make the hour lines from 2 to 10 o'clock, look in the table for 2 and 10 hours, where you will find 24 degrees and 26 minutes, which take off the degrees of your quadrant, and mark as the other from the 12 o'clock line, both ways in the circle.

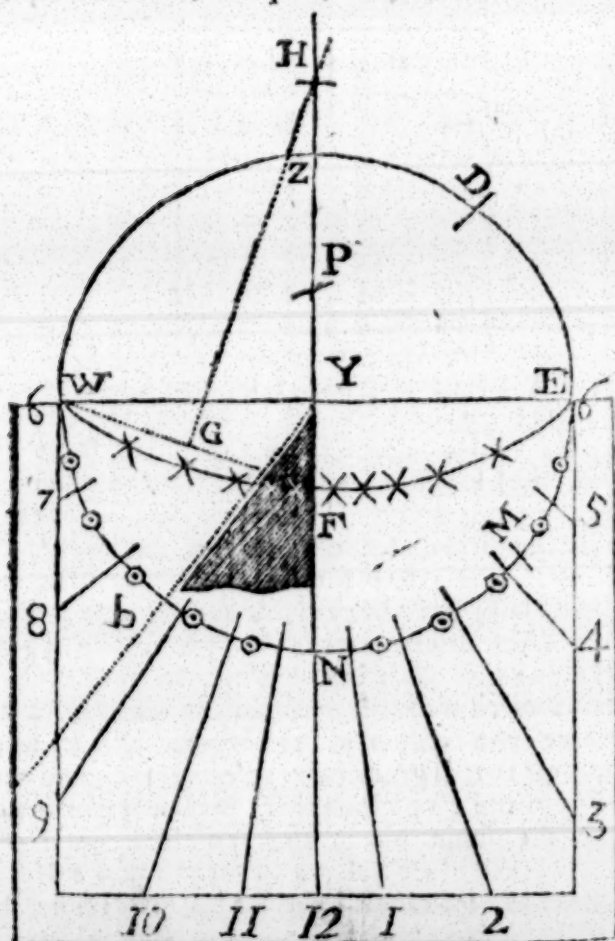

Observe the same for 3 and 9 o'clock, and 4 and 8 o'clock, and 5 and 7 o'clock; and for the hours of 5 and 7, 4 and 8 above the 6 o'clock line, set off the distance below.

Then for the height of the gnomon or stile, which must be always equal to the latitude of the place where your dial is

to be used, as suppose 52 degrees, take it off the edge of the quadrant with the compasses as before; and with that extent, set one foot at the bottom of the 12 o'clock line, as you did before, and extend the other foot in the circle, and make a mark and draw a line from thence to E, the centre (for the edge, as you may see in the dial, is shaded with short lines) but the stile is to stand upright in the 12 o'clock line, and it will cast a shadow upon the hour of the day.

*To make an erect South Dial.*

Those are said to be erect or upright, which stand perpendicular to the horizon of the place; such as are against the walls of churches, steeples, &c.

First draw the circle Z E W N, then cross it with Z, Y N for the meridian or 12 o'clock line, and W Y E for the prime vertical circle or hour line 6; then out of your line of chords, take 38 degrees, 29 minutes (the complement of the latitude of the place) and set that distance on the dial plane from Z to d, and from E to m, and from N to b:

Then lay a ruler from W to d, and it will cut the meridian Z N in the point P, the pole of the world; and a ruler also laid from W to M, will cut the meridian in F, which is the point through which the equinoctial must pass, for the drawing of which, you have 3 points given, *viz.* E F and W to find the center, which must always be in the meridian line Z N.

To find the center; first draw a line from F to W, then upon that line raise a perpendicular as the line G H, to cut the meridian line in H; again, divide the semi circle E N W in equal parts, as the points o o o &c.

Then lay a ruler to Y, and each of the points o o o, &c. and the ruler will cross the equinoctial circle in the points, \* \* \*, &c. dividing that into 12 unequal parts.

Again, lay a ruler to P (the pole of the world) and every one of the marks \* \* \*, &c. and the ruler will cross the circle of the plane in the points | | |, &c.

Lastly, if through the center Y, and the respective point | | |, &c. you draw lines, they will be true hour lines of an erect south plane.

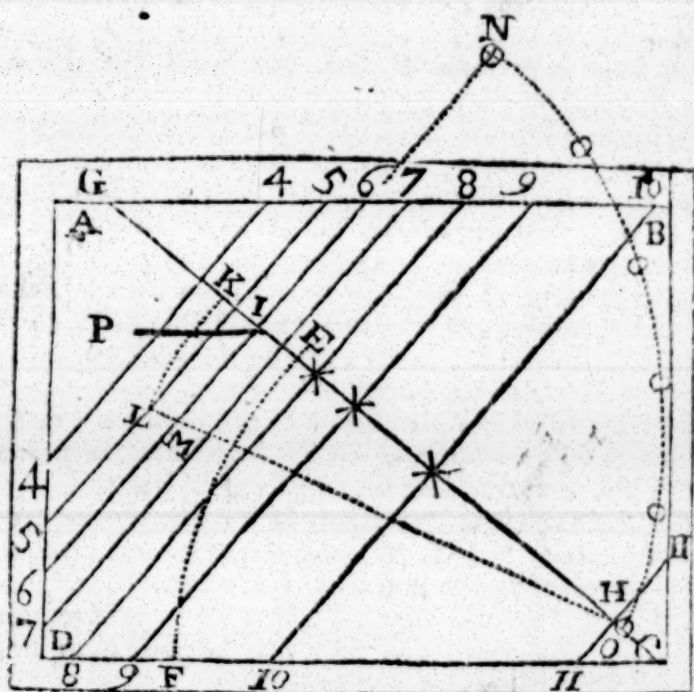

For the gnomon or stile, take 38 degrees, 29 minutes, out of the line of chords, and set them from N to b, drawing the line Y b for the axis of the stile, which must hang directly over the meridian or hour line of twelve, and point downwards to the south pole; because the plane beho'ds the south part of the meridian.

In making this dial, you make two dials; for the erect direct north dial is but the backside of the south; for as this beholdeth the south part of the meridian, so the other faceth the north part of the meridian; and as the meridian line in the south dial shews when it is twelve o'clock at noon, so the backside thereof, *viz.* the north side, represents the hour line of 12 o'clock at midnight. but a north dial is almost useless, be cause the sun is never seen by us above the horizon, only at the hours of 4, 5, 6, 7, and 8

318 *Youth's faithful Monitor: Or*

in the morning, and 4, 5, 6, 7 and 8 at night, and (in this latitude) not all of them neither; therefore I think it needless to trouble the reader with it.

*A direct east Dial in the Latitude of 51 deg. 31 min.*

Admit A B C D to be the dial plane, on which is to be drawn a direct east dial, which must be upon the point C; but if a west dial, upon the point D. First with the radius (or chord of 60 degrees) describe the obscure arc E F, then from the chords take 38 deg. 29 min. the complement of the latitude of the place, and set from F to E, and draw the line C E quite through the plane to G; then that you may proportion the stile to the plane, so that you bring on all the hours from sun-rising to eleven o'clock, assume any two points in the line C G, one towards the end C (as the point H) for the hour line of 11, and another about three quarters the length of the line, as the point I for the hour line of 6; and through the point H and I, draw the lines 11 H 11, and 6 I 6. On the point H with

H with the chord of 60 degrees, describe the obfure arc K L, then with the compaffes take 15 degrees from the chords, and fet one foot in K, and with the other cut the arc K L in L. Through H and L draw the line H M L, which will cut the line 6 I 6 in the point M, fo fhall M I be the height of the perpendicular ftile, proportioned to this plane.

To draw the hour lines, open the compaffes to the chord of 60 deg. and fet one foot in M, and with the other describe the arc N O, between the hour line of 6 and the line H L; and divide the faid line into 5 equal parts, as the points o o o, &c. Then laying a ruler from the point M, to each of the points o o o, &c, it will cut the equinoctial line GH in the points \* \* \*, &c. through which points draw lines parallel to 6 I 6, as the line 7 \* 7, 8 \* 8, &c. As for the hourlines 4 and 5, they are eafily done, thus, lay off the fame diftance from 6 to 5, as from 6 to 7: and for the diftance between 5 and 4, lay of the fame diftance as from 7 to 8, and it is done.

The fame dimensions ferve for a weft dial, only the arc F E muft be drawn on the left hand of the plane, and the hour lines 4, 5, 6, 7, 8, 9, 10, 11 on the eaft dial, muft be 8, 7, 6, 5, 4, 3, 2 and 1, on the weft.

The ftile of the eaft or weft dial, may be either a pin of the length of the line I P. which is equal to I M, and muft be fixed in the point I on the hour line of 6, and exactly perpendicular to the plane; or it may be a plate of brafs of the fame breadth, with the diftance of the hour lines of 6 and 3, which likewife muft be fet perpendicular upon the hour line of 6, and the fhadow of the upper edge thereof will fhew the hour.

*Of Beautifying and Colouring Dials.*

**F**IRST, the boards are to be brushed over with Linfeed oil, thinly ground with Spanifh brown, done over three or four times (drying between each time) a little thicker each time with the colour; and this is called priming.

*To make the fat Oil for Dials.*

Boil red lead and linfeed oil, and a little litherage of gold (about a penny-worth) together, till almoft at thick as fyrop; and when cold and well fettled, pour the cleareft into a bottle or bladder for ufe.

*The*

*The Gold Size for Dials.*

Mix fine ground yellow oaker with the aforesaid fat oil, to such a consistency, as when used, it may settle smooth of itself.

*A Mixture for Hour Lines.*

Grind Vermillion or Lamp-black with the fat oil.

*To draw golden Letters or Figures for the Hours.*

First draw them with a pencil dipt in the gold size before mentioned; which when so dry as just to stick to your fingers, then with a smooth-edged pen-knife shape your leaf gold to your mind; take it up with a piece of cotton cloth, fixt to the end of a stick, and lay it on the size, pressing it down with the same cotton, and, when dry, brush off the loose gold with a feather, and smooth the rough edges of the letters with a pencil dipped in red or black colour.

*Of mixing Colours.*

Colours are mixt by being ground on a stone with fair water severally, and dried, and kept in paper bags for use, except Lamp-black, Saffron, Smalt, Gambogia, and Sap-green.

Blue, to compound; temper a little Indigo and Smalt with oil.

A light blue; mix Smalt and White-lead together.

Lead colour; mix Lamp-black and White-lead together on a marble.

A Fox colour; is Umber burnt.

Gold colour; is Orpiment mixt with fat oil, by a knife on an earthen plate, or gally tile rather.

To hinder colours from cracking, put oil of walnuts to them.

Yellow colour; beat Saffron to powder, and steep it in vinegar.—Or take the yellow chives in white lillies and Gum-water mixt for writing.

Red; Vermillion with Gum-water mixt for writing.

Golden letters, to write; mix Vermillion and Gum Armoniac with yolks of eggs.

A choice

A choice COLLECTION of Curious RECEIPTS.

*An excellent Drink for a Cough.*

TAKE two ounces of saffras, two ounces of linseed, two ounces of stick liquorice, and two ditto of brown sugar candy; boil all together in a gallon of water, till it decreases to three pints. Drink a draught in the morning fasting, or as often in the day as you like.

*To fine down a Cask of foul Wines.*

Take  $\frac{1}{2}$  of a pound of masons dust, the white of four eggs, or in proportion; beat it well up together, and pour it into your cask; let the bung remain off about ten minutes, and then stop it down.

*A never failing Receipt to cure a Cough, or prevent a Consumption.*

Take ground-ivy fresh gathered, and bruise it in a mortar, till you extract three ounces of juice, to which add two ounces of brown sugar-candy; simmer it over a slow fire, and skim it till it be fine; let it stand till clear, and bottle it off for use. Take a table spoonful night and morning.

*A certain Cure for the most severe Flux.*

Take a quantity of water cresses, and boil them in clear water for fifteen minutes, strain them off, and drink half a pint of the decoction every now and then, about milk-warm.

*A never-failing cure for the Hic-cough.*

A single drop of chymical oil of cinnamon, dropt on a piece of treble-refined sugar; let it dissolve in the mouth leisurely.

*An approved Method of taking away any Scale or Film from the Eyes.*

Borax must be finely pounded in a marble mortar, and a small quantity thereof blown into the eye every morning and evening; it will eat away the speck or film, and not in any wise injure the humours of the eye.

*To destroy and prevent Bugs and other Vermin.*

Mix, with the solution of vitriol, the pulp of coloquintida, and apply the mixture to all the crevices, which serve as a nursery to vermin; the solution alone has proved effectual; but if applied to stone or brick walls, it may be mixed with lime, which will give it a lively yellow, and insure its success. The boiling any kind of wooden work in the solution of vitriol, effectually prevents it from taking the worm, and preserves it from rottenness and decay.

*To gild with Leaf-gold.*

Grind leaves of gold in a few drops of horey; add to it a trifle of gum water, and it will be excellent to write on paint with.

*To make fine red hard Sealing Wax.*

Take half a pound of shell or gum lack, melt it in an earthen vessel; then put an ounce and an half or two ounces of purely ground fine vermillion; mix them well over the fire, and when it is of a fit composition, make it up into balls or cakes; and to set a gloss upon it, heat it gently over a charcoal fire, and rub it with a cloth till it is cold.

*How to make black Wax.*

Mix ivory black with shell or gum lack, as by the foregoing receipt.

*An approved Cure for the Rheumatism.*

Take five ounces of stone brimstone, reduce it to a fine powder, divide it into 14 equal parts, and take one part every morning fasting, in spring water. Note, this receipt came from a worthy clergyman; he said it had, to his certain experience, a very good effect upon great numbers of people that made use of it.

*Against Moths, Worms, &c.*

Dry the herb Botris, strew it among your clothes, and neither moth nor worm comes near them.

*Ague speedily cured.*

Wear the leaves of lignum vitæ under your feet a few days, and a cure soon follows. This receipt from a divine.

*Dr. Dover's excellent Cure for the Itch.*

Sweet sublimate one drachm, cream of tartar one ounce. Let these infuse two or three days in a pint of spring water; then bathe the parts broke out therewith, morning and evening, for four or five days, and the cure will be completed. This is not only very effectual in curing, but very safe, cheap and clean. Bleeding is very necessary in this disorder. *N. B.* This is the chymical lotion advertised at 1s. 6d. the bottle, which contains little more than a quarter of a pint; here you have a pint for three pence, which is the charge of the two ingredients.

*Warts or Corns speedily destroyed.*

Rub them with juice of house-leak and celandine, twice a day for a week, and you may depend upon getting rid of them: If the corns are first cut as close as the person can bear, they will the sooner be destroyed. Multitudes have been taken away by only binding a single leaf of house leak over each corn, and this in four or five days, and without the least pain.

*Chinese Method of mending China.*

Boil a piece of white flint glass in river water five or six minutes, beat it to fine powder, and grind it well with the white of an egg, and it joins china (without rivitting) so that no art can break it again in the same place. You are to observe the composition is to be ground extreemly fine, on a painter's stone.

*A sure and speedy Cure for the Scurvy.*

Drink plentifully of whey, with juice of elder flowers in it, and a cure will soon be completed.

*Infalible Cure for a Whitlow.*

Steep it in distilled vinegar hot as you can bear it, four or five times a day, for two days successively; then moisten a leaf of tobacco in the said vinegar, bind it round the part grieved, and a cure soon follows.

*To stop bleeding at the Nose.*

Rub the nostrils with the juice of nettles, or young nettles bruised.

*Having*

*Having gone through the necessary Instructions for Youth, so as to complete him for Business, I think it now necessary for him to apply his mind to history, in order the better to qualify him for company and conversation: And as no one history in the world abounds with such variety of incidents as the history of England, I have taken the pains to render this so concise and intelligent to the youthful reader, as must, by very little application, make him able to discourse upon the most material parts; and as it is solely calculated for the knowledge and instructions of youth, care has been taken to avoid those immaterial and obsolete parts of history that bear no sort of reference to our present design.*

**E**NGLAND and Scotland, though but one island, are two kingdoms, which were united in the reign of king James I. and called Great Britain. The shape of it is triangular, and surrounded by the seas; its utmost extent or length is 812 miles, its breadth 320, its circumference 1836 miles; and is reckoned the finest island in Europe.

The whole island was originally called Albion. The people that first lived in this island were the Gauls, and afterwards the Britains, so named by Brutus, a Grecian hero, who having landed here about 1100 years before Christ, changed its antient name of Albion to Britannia; from which time to the arrival of Julius Cæsar, there had reigned 69 kings, all natives of England.

They were generally tall and well made, and lived frequently to 120 years, owing to their sobriety and temperance, and the wholesomeness of the air. Clothes were not known among them; but they used to cover themselves with skins, to avoid giving offence to those who trafficked with them. Their bodies they painted with juice of woad and lived in huts covered with skins and boughs of trees: Their towns or villages were a confused parcel of huts, at a little distance from each other, without order or distinction of streets. Friends and brothers lived together, and had their wives in common. They had great quantities of fish, and tame fowl which they kept for pleasure, and were forbid by their religion to eat; but lived chiefly upon milk and game caught in the woods. Their chief commerce was with the Phœnician merchants, who, after the discovery of the island, exported every year great quantities

les of tin, with which they drove a very gainful trade with distant nations.

In this situation remained the antient Britains, till Julius Cæsar, the first Roman emperor, formed a design of invading their islands. The Britains endeavoured to divert him from his purpose, by sending ambassadors with offers of obedience, which he refused; and in the 55th year before the coming of Christ, embarked a number of troops on board eighty ships. The Britains boldly and vigorously endeavoured to prevent his landing, but being overpowered by numbers, and loath to expose themselves to greater mischiefs, sent to sue for peace, and offer hostages, which Cæsar accepted, and concluded the peace after four days landing. In respect to the Roman period, Cæsar's landing from Gallia made it tributary to the Romans. Not soon after the birth of Christ, the emperor Claudius brought this country under his subjection; and after the Romans had been in possession of Britain for near 500 years, they left it to its ancient inhabitants again. In the beginning of the 2d century, the Christian religion was planted in England; and in the 5th century the Britains finding themselves overpowered by the Scots and Picts, called over the Saxons to their assistance, who were so charmed with the country, that they determined to continue here and subdue it. They divided the country among themselves into seven kingdoms, known by the name of the Saxon heptarchy, viz. 1st. Kent, 2d. Essex, 3d. Sussex, 4th. Wessex, 5th. East Anglia, 6th. Mercia, 7th. Northumberland. But at length Wessex, or the West Saxons who had for their king Egbert, in the year 827, reduced the other kings of the heptarchy and settled the English monarchy. He was crowned king of England at Winchester, and continued the conquered kings as vice-roys or tributaries. In his reign England was invaded by an army of 23000 Danes, but he forced them at last to leave him in quiet possession. After a reign of 11 years he died, and was buried at Winchester, where he held his royal seat.

831. **ETHELWULF**, Egbert's son, was bishop of Winchester when the crown fell to him, and could scarcely be prevailed upon to accept it. He was a great votary to the papal see, and a good friend to the clergy. He went in pilgrimage to Rome, confirmed the tax called Peter's

Pence, and made part of England tributary to the Pope. His reign was disturbed by the Danes, but he conquered them at Okely. He reigned 17 years, and left 4 sons, who all succeeded to the crown, viz. Ethelbald, Ethelbert, Ethelred and Alfred.

855. **ETHELBALD**, who married Judith his mother-in-law, reigned only five years. He had the good fortune to be too hard for the Danes; and was buried at Salisbury.

860. **ETHELBERT**, his brother, succeeded him. He was a virtuous prince, much troubled by the Danes, tho' often victorious over them. He reigned but six years, and was buried at Sherborn.

866. **ETHELRED**, brother of Ethelbert, fought nine battles in one years time with the Danes, whose cruelty spared neither age nor sex; they burnt York and abundance of monasteries. This king reigned but six years, and was buried at Winburn in Dorsetshire.

872. **ALFRED**, the surviving brother, proved a most excellent prince and fond of learning; but being near conquered by the Danes, by stratagem he at length overcame them near Abington. Having rid himself of those troublesome guests, he made justice and learning flourish in the land. He divided England into shires; and founded the university of Oxford. After reigning 29 years he died and was buried at Winchester.

901. **EDWARD**, surnamed the elder, was son of Alfred and had a sister named Alfreda, a martial princess, who assisted him in his quarrel with the Danes, whom he mastered. He reigned 23 years, and was buried at Winchester.

924. **ATHELSTAN**, son of Edward, succeeded his father. He proved a magnanimous prince, and was courted by most princes of Europe. He vanquished the Danes, and drove them into Northumberland. He subdued Wales and made it tributary. Cornwall and the isles of Scotland were by him annexed to the crown. Guy of Warwick lived in his reign, who slew Colbrand the Danish Goliath. In his time also the bible was translated into English Saxon. He reigned 16 years, died at Gloucester, and was buried at Malsbury.

940. **EDMUND**, surnamed the pious, brother of Athelstan, was in his reign insulted by the Danes, but by the assistance of the king of Scots, they were totally defeated. Edmund

Edmund recompensed that king with the counties of Cumberland and Westmoreland, which remained in the hands of the Scots till Henry II. He was assassinated as he was feasting among his nobles, by one Leof, whom he had banished; and was buried at Glastonbury, leaving two infant sons, Edwin and Edgar, who were both set aside to make room for their uncle.

948. EDRED usurping the crown from his nephews, reigned but seven years, and was buried at Winchester.

955. EDWIN, Edmunds eldest son, succeeded his uncle. He proved a bad prince. He banished Dunstan, abbot of Glastonbury, who got him deposed, which caused him to die with grief, after a reign of four years. He was buried at Winchester.

959. EDGAR, Edmund's youngest son, succeeded his brother at the age of 16. He recalled Dunstan from banishment, and advanced him to the see of Canterbury. Having reigned 16 years, he was buried at Glastonbury.

975. EDWARD, surnamed the martyr, a natural son of Edgar, usurping the crown from his brother Ethelred, a lawful son of Edgar, by Alfrida his queen; reigned but three years, being assassinated by order of his mother-in-law at Corf castle, to make way for Ethelred. He was canonized some time after, and ranked among the martyrs.

978. ETHELRED, surnamed unready, lawful son of Edgar by Elfreda, was so harried by the Danes, that he paid them yearly tribute of 40,000 l. The Danes growing so imperious and burdensome, living upon free quarter, Ethelred caused 24000 of them to be massacred in one night: which bloody scene drew upon him the resentment of Sweyn, king of Denmark, who came over in person with a fleet and land forces, followed by a reinforcement commanded by his son Canute. Ethelred fled beyond sea to the duke of Normandy, and left his subjects to the mercy of the invaders; but on the death of Sweyn returned home, died soon after, and was buried at Glastonbury.

1016. EDMUND, surnamed Ironside, from his great strength, Ethelred's son, contended for the crown with Canute the Dane, and after much blood-shed on both sides, agreed to decide the battle by single combat. Canute being wounded, agreed to divide the kingdom between them. The south of England fell to Edmund, and the  
E f z north

north to Canute. But Edmund being soon after assassinated by Edrick, Canute seized upon the whole. Edmund reigned but 7 months, and was buried at Glastonbury, leaving two sons, Edward and Edmund. He had, during his short reign, given frequent testimonies of his exalted valour, the most consummate prudence and utmost goodness.

## DANISH KINGS.

1017. **C**ANUTE being in possession of the whole kingdom, caused Edrick the murderer to be beheaded. He banished the sons of Edmund; and married Emma, the widow of king Ethelred, by whom he had two sons, Sweyn and Canute. The first was his successor in the kingdoms of Denmark and Norway; and the other was supplanted by

1035. **H**AROLD I, a base son of Canute, surnamed Harefoot. He proved a tyrant to queen Emma, whose son Alfred by Ethelred he treacherously murdered. He reigned 5 years, and was buried at Westminster.

1040. **H**ARDICANUTE, son of Canute and Emma, succeeded his supplanter, whose corpse he caused to be dug out of the grave and thrown into the Thames. He was a great Epicure, and died at a wedding. He reigned but 2 years, and was buried at Winchester.

Thus ended with him the tyranny of the Danes in England, who oppressed it for above 200 years. The Saxon blood being restored, the Danes remained mixt with the English, and became one nation.

## SAXONS Re-inthroned.

1042. **E**DWARD the confessor, Ethelred and Emma's 7th son, succeeded Hardicanute. He caused his mother Emma to undergo the ordeal, or fiery trial by walking barefoot over red-hot irons. His great affection for the Duke of Normandy made way for the Roman conquest. In his reign he banished earl Goodwin, but soon recalled him. He re-built Westminster abbey, and dying without issue, after a reign of 24 years, was buried in the said abbey, and afterwards canonized for a saint.

1066. **H**AROLD II, son of earl Goodwin, by Thyra, a base daughter of Canute I. succeeded Edward, to the prejudice

Justice of the grand child of Edmund Ironside. He did not long enjoy his usurpation, being slain 8 months after, in the battle of Hastings; between him and the duke of Normandy; which was fought October 14, 1066, nine miles from Hastings in Suffex. His body was royally interred at Waltham in Essex.

*The NORMAN LINE from WILLIAM the Conqueror, to JAMES I. Monarch of Great Britain.*

1066. **W**ILLIAM II. surnamed the conqueror, 7th. Oct. 14. duke of Normandy, and only son of Robert, by Arlotte, a skinner's daughter; laid claim to the crown of England, as a donation from his cousin Edward the confessor. To get possession of it, he came over with a force of 50,000 men, and landed at Pemsley in Suffex. He came like a conqueror, and reigned like a tyrant. He disarmed the English, allowed them neither fire nor candle after eight o'clock at night; built the tower of London, with several other fortresses; siezed upon all offices of honour and profit, and gave them to his Normans. He levied to the ground 36 towns and villages, with as many churches, in Hampshire, to make the new forest, in which, it is remarkable, two of his sons were killed, as they were hunting. He built Battle Abbey in the place where Harold was slain, and made the doomsday book. The severity of his reign made it very turbulent to him; when he was here, Normandy rebelled; and when there, England did the same. Scotland and Ireland gave him some disturbance, and none of his subjects could endure him. He died and was buried at Caen in Normandy, after reigning 21 years. He left three sons, viz. Robert, William and Henry.

Sep. 9. 1087. WILLIAM II. surnam d. Rufus, siezed upon the crown, in prejudice of Robert his elder brother, then beyond sea. Robert coming over, matters were agreed on that William should remit him a yearly sum, and Robert to succeed him. This king proved milder to his subjects than his father. He built Westminster hall; made Malcolm, king of Scots, tributary; and quelled several insurrections in Wales. In his reign, Earl Goodwin's lands, being 5000 acres, were overflowed by the sea. William was killed in the New Forest, by an arrow levied

at a deer, by Sir Walter Tyrrel. He reigned 13 years, and was buried at Winchester.

*Aug. 1. 1100.* HENRY I, youngest son of William the conqueror, succeeded next, Robert being in the Holy Land. He restored the free use of fire and candle; forgave all debts to the crown before his coming to it, and confirmed the laws of Edward the confessor. The greatest blot to his reign, was his cruelty to Robert his eldest brother, whom he brought prisoner to England, and confined him in Cardiff castle, in Wales, with hard usage, the space of 26 years. As Oxford university was restored by Alfred, so was Cambridge by Henry. He died in France, but was brought over and buried in the abbey of Reading. He reigned 35 years; and Matilda (Maud) his heiress, descended from Edmund Ironside, was set aside by the power of the clergy, to make room for

*Dec. 2, 1135.* STEPHEN, a grandson of the conqueror, by Adela his daughter and her husband Stephen Earl of Champagne and Blois. But as he was an usurper, so his reign proved troublesome from Matilda, the right heir; who in pursuance of her right, spun herself and Stephen a long thread of troubles. He adopted Henry, son of Matilda to succeed him. Having reigned 19 years, he died at Dover, and was buried at Faversham.

*Oct. 25, 1154.* HENRY II, son of Geofrey Plantagenet, earl of Anjou, succeeded Stephen. In him the Norman and Saxon blood was united; and with him began the race of the Plantagenets, which ended with Richard III. He recovered Cumberland and Westmoreland from the Scots, which had been subject to them above 200 years. He subdued the Welch, and conquered Ireland. He had a concubine called Rosamond, daughter of Lord Clifford, whom he kept at Woodstock in Oxfordshire. Being gone to Normandy, the queen took that opportunity of poisoning her, for which she was imprisoned till the king's death. In his reign, Thomas a Becket, son to a tradesman in London, being bred to the law, was made lord high chancellor, and afterwards archbishop of Canterbury. Several rapes and murders being committed by the clergy, and Becket refusing to punish them, was banished by the king. But being recalled and continuing refractory, he was murdered in Canterbury cathedral, by four courtiers, on

Christmas

Christmas day, as he was saying prayers at the altar. The king submitted to a grievous penance for it, which was to walk three miles barefoot to Becket's tomb, and be scourged on the back by the monks of Canterbury. He reigned 35 years, died at Chinon in Normandy, and was buried at Fonteverard.

July 6, 1189. RICHARD I. for his valour surnamed Lion heart, succeeded his father Henry II. He signalized himself in the holy war; but being deserted by the French, he returned home without taking Jerusalem. Being separated from his fleet, and coming by land through Germany, he was taken prisoner by the emperor, and obliged to pay 10,000 marks for his ransom. In a war between England and France, Richard fought personally in the field and gained a compleat victory over the enemy, but was unfortunately afterwards shot with an arrow, at the siege of the castle of Chalus. He was buried at Fonteverard, after a reign of ten years. In his time lived Robin Hood and Little John, two famous robbers. And in his reign the city of London assumed a new form with regard to its government, it being divided into corporations, or as they are now termed, companies.

Apr. 6, 1199. JOHN, 4th son of Henry II, took possession of the crown, on Richard's decease, in prejudice of Arthur his nephew. He immortalized his name by granting his subjects the charter of forests, and the Magna Charta, or charter of liberties, which has been ever since esteemed the measures of the English government. He granted the Londoners to chuse yearly a mayor and common council. In his time London bridge was built of stone. He reigned 17 years; and is reported by some to have died at Newwark of a fever, by eating of peaches; and by others to have been poisoned by a monk at Swinstead Abbey, Lincolnshire. He was buried at Worcester.

Oct. 19, 1216. HENRY III. succeeded his father John at 9 years of age. He proved but a weak prince; and great part of his life was embroiled in a civil war. Such was this king's prodigality, that it brought him to poverty and contempt. For a sum of money he renounced his right to Normandy and the other French provinces. He founded the house of Converts, and an hospital at Oxford. He reigned 56 years, died at St. Edmund's-bury, and was buried at Westminster.

*Nov. 16, 1272.* EDWARD I. son of Henry, was in the holy land when his father died. He proved a very successful warlike prince. He was a terror to France, subdued Wales and conquered Scotland, and brought from thence the famous stone and coronation chair, now in Westminster abbey. He created his eldest son prince of Wales, which title has been enjoyed ever since by the eldest sons of all the kings of England: And in his last moments exhorted his son to continue the war with Scotland. He reigned 35 years, and was buried at Westminster.

*July 7, 1307.* EDWARD II. commonly called Edward of Caernarvon, succeeded his father, but proved an unfortunate prince; being despised by his nobles, and slighted by the commons; he was first debauched by Gaveston, his favorite, and afterwards by the two Spencers, father and son. The barons took up arms against the king, Gaveston was beheaded, the two Spencers hanged, and himself compelled to resign the crown to prince Edward III. his son. Soon after, he was barbarously murdered at Berkley castle, by Mortimer, the queen's favourite. He reigned 20 years, and was buried at Gloucester.

*Jan. 20, 1327.* EDWARD III. succeeded his father Edward II. Through a procurement of Mortimer, a favourite of his mother, he made a dishonourable peace with Scotland; for which and other crimes, Mortimer lost his life soon afterwards. He made a new conquest of Scotland, and took David Bruce, their king, prisoner. This king's eldest son, surnamed the black prince, gained two surprising victories, one at Cressi, the other at Poitiers, in which he took king John and his youngest son Phillip prisoners. In his reign was instituted the noble order of the garter; and the title of duke of Cornwall being first conferred on the black prince, continued as a birth right to the prince royal of England. Edward the black prince died in 1376, whose untimely end hastened his father's death, who after reigning 30 years, died at Shene in Surry, and was buried at Westminster.

*June 21, 1377.* RICHARD II. son to Edward the black prince, inherited his grand-father's crown, but had neither his wisdom nor good fortune. He was born at Bordeaux in France: His managements in England made his reign troublesome to his subjects, and in time lost him the crown.

*The Young Man's best Companion.* 333

He raised a tax of four-pence per head, which occasioned an insurrection by Wat Tyler, who being stabbed by William Walworth, then lord mayor of London, the insurrection was quelled. The duke of Gloucester being smothered, and the duke of Lancaster's goods unjustly seized, with a design to banish his son, compleated the king's ruin. After great cruelties and tyranny, he was compelled to resign his crown; and being confined in Pomfret castle, Yorkshire, he was barbarously murdered. He reigned 22 years, and was buried at Langley.

*The LINE of LANCASTER, called the RED ROSE.*

Sept. 29, 1399. **H**ENRY IV. who succeeded his cousin Richard, was son of John, duke of Lancaster, the fourth son of Edward III. He came to the crown by the power of the sword; but by consent of the people. As he acquired it by the sword, so he kept it by suppressing factions; quelling the Scots, and reducing the Welch. He reigned 13 years, died at London, and was buried at Canterbury.

March 20, 1413. **HENRY V.** eldest son of Henry IV. though a loose prince in his youth, proved a wise, virtuous and magnanimous king. He banished his loose companions from court; and claimed the English title to the crown of France so effectually, that with 14000 men he beat the French at Agincourt, tho' 140,000 strong. At that time there reigned in France, Charles VI. a weak prince, who was prevailed upon by his queen to disinherit the Dauphin, and give his daughter Catherine to Henry, who was declared heir to the crown of France, and regent during the king's life; but did not live to sit on the throne of France. He reigned but 10 years, died at Vincennes in France, and was buried at Westminster, in the 39th year of his age. He left the care of Henry VI, a new born son, his successor, to the cardinal of Winchester. The government of England, till the prince was of age, he left to Humphry, duke of Gloucester; and the regency of France to the duke of Bedford, his two brothers.

Aug. 31, 1422. **HENRY VI.** was a weak and unfortunate prince. The crown of England being disputed between him and the house of York, occasioned such civil wars

wars in England, as made her bleed for 84 years, when all the princes of York and Lancaster were either killed or beheaded. The French, taking this favourable opportunity, shook off the English yoke, and recovered their liberty in 5 years, and placed Charles VII, the young dauphin on the throne of France. The crown of England was now setled by parliament upon the House of York and their heirs, after the death of Henry, whose heirs were excluded for ever. This prince passed thro' various changes of life, and was at last stabbed by Richard, duke of Gloucester, who had before murdered Edward, the only son of this unfortunate king.

*The LINE of YORK, called the WHITE ROSE.*

March 4, 1461. **E**DWARD IV, eldest son of Richard duke of York, proved a valiant prince in war, but effeminate in peace. Such were the revolutions of this king's reign, that he was forced to fly into France; Henry replaced and deposed, and Edward re established; Henry being twice made a prisoner to Edward, and Edward once to Henry. Tewkesbury fight at last decided the quarrel in favour of Edward, in which queen Margaret and her son prince Edward were taken prisoners. The prince was killed by bloody Richard, duke of Gloucester, and king Henry was murdered a little time after in the tower, by Richard's contrivance, but the queen was ransomed. This Richard aiming at the crown, got his elder brother George duke of Clarence out of the way, and procured his death by an impeachment of high treason. Edward leaving two young sons when he died, Richard found means to dispatch them likewise, and clear his way to the throne. At last Edward died, having reigned 22 years, and was buried at Windsor. In his reign the art of printing was brought into England.

April 9, 1483. EDWARD V, eldest son of Edward IV, succeeded his father, but was cut off with his brother Richard, by their uncle Richard, who caused them to be smothered in bed in the tower, so that this young king reigned only two months.

June 22, 1483. RICHARD III, surnamed crook back youngest brother to Edward IV. and uncle to Edward V. having dispatched his nephews, succeeded to the crown, and was the last king to the house of York. He was an usurper.

murderer, and his cruelty so incensed the duke of Buckingham, his favourite, to such a degree, that he contrived his ruin, and offered the crown to Henry earl of Richmond, the only surviving prince of the house of Lancaster, then at the court of France, on condition that he would marry Elizabeth the eldest daughter of Edward IV. in order to unite the houses of York and Lancaster. Richard being informed of the affair, ordered the duke to be instantly beheaded without a trial. However, this did not discourage Henry who had accepted the offer. He came over with a small force, and landed in Wales where he was born, his army increasing as he advanced. At length, having collected a body of 5000 men, he attacked Richard in Bosworth field in Leicestershire, in 1485. Richard fought bravely till he was killed in the field, and so made way for Henry to the crown of England.

*The two contending Families of YORK and LANCASTER  
united, in the Person of*

Aug. 22, **H**ENRY VII, who succeeded next to Richard 1485. upon his victory at Bosworth. He was a prince of great sagacity, but very unjust and cruel; nor was his reign free from troubles: To which the queen's own sister, the dutchess of Burgundy, who was a profest enemy to the house of Lancaster, mainly contributed by her two impostors, Perkin Warbeck, and Lambert Simuel, who personated Edward V, and Richard his brother, both pretending to be still living. The end thereof proved comical in Lambert, and tragical in Perkin. The first having been crowned king in the cathedral of Dublin, was afterwards taken, and made a turn spit in king Henry's kitchen; but Perkin, after great honour done him in several courts, as a prince of the blood royal of England, was at last hanged at Tyburn. Edward Plantagenet, earl of Warwick, the last prince of that race, was beheaded for attempting to make his escape, after being imprisoned from nine years old. As he grew old, he grew covetous; and to increase his treasures he caused all penal laws to be strictly put in execution. He built that noble chapel joining to the collegiate church of Westminster, which is called to this day Henry the VIth's chapel; in which he

was

was buried, having lived 52 years, and reigned almost 24. He died at his palace in Richmond, and left in ready money 1,800,000 l. to his successor. He had two daughters, Margaret and Mary. The first he wisely married to James IV, of Scotland, and Mary to Lewis XII, of France, foreseeing, that if the crown of England should fall to France by right of inheritance, England might look upon France as the greater kingdom of the two. But falling to Scotland, as it did actually in the person of king James I. Scotland must look upon England as the greater kingdom.

*April 22, 1509.* HENRY VIII, born at Greenwich in 1491, was the only surviving son of Henry VII. He reigned for some years with great applause, till being vitiated by cardinal Woolsey, luxury and cruelty obscured his virtues, and stained his former glory. Of six wives, Katherine of Spain, Ann of Bullen, Jane Seymour, Ann of Clevee, Katherine Howard, and Katherine Parr, he parted with two; viz. Katherine of Spain and Ann of Clevee: The first as an incestuous match, she being the widow of his elder brother: And to Ann of Clevee he had a personal aversion, and so never knew her. He beheaded Ann of Bullen for pretended adultery, and Catharine Howard for the real fact. Upon his divorce from Catharine of Spain, he married Ann of Bullen, for which he was excommunicated by the pope; but Henry, being proof against the thunder bolts of Rome, shook off the pope's supremacy. Thus a foundation was laid for a reformation from the abuses and errors of the church of Rome, to which Thomas Cranmer did very much contribute, who was therefore preferred to the see of Canterbury. Mean while all the monasteries in England were dissolved, and six new bishopricks erected, Westminster, Oxford, Peterborough, Bristol, Chester and Gloucester, all which, except Westminster, now continue. Though he discarded the pope, he retained to the last many errors of the church of Rome; and proved a two-edged sword, sparing neither the opposers of his supremacy, nor those who denied transubstantiation, hanging the first, and burning the last. Cardinal Wolsey, who lived in the greatest state of any prelate in Christendom, fell under his displeasure; and Cromwell, earl of Essex, his great servant and favourite, was beheaded. The same fate had Sir Thomas Moore, lord chancellor, and John Fisher, bishop

bishop of Rochester, for disowning the king's supremacy. He suppressed several rebellions; one in Lancashire, one in Yorkshire, and another in Ireland. Wales was in this reign united to England; and Ireland made a kingdom. After this, Henry's friendship was equally courted by the emperor Charles V, and the French king Francis I, then at war. The emperor carried it at first, who came twice over into England: But cardinal Wolsey aiming at the papal chair, and finding the emperor thwarted him in his design, got the king over to the French interest. To unite Scotland to England, a match was concluded between prince Edward, his son, and Mary the young queen of Scots; but afterwards broke off by the power of the Hamiltons, and the French interest. This occasioned a new war, both with France and Scotland; in which Henry took Boulogne from the French, and destroyed with fire Leith and Edinburgh in Scotland. Thus reigned Henry about 38 years, a prince at first of great virtues, and at last of great vices; who being grown boisterous and arbitrary, kept his parliament in awe, and became a terror to all his subjects. He died January 28, 1547, and was buried in Windsor Chapel. The children he left were his three successors, who all died without issue, viz. Edward by Jane Seymour, Mary by Catherine of Spain, and Elizabeth by Ann Bullen.

Jan. 28, 1547. EDWARD VI, only son of Henry VIII, by Jane Seymour, his third wife, was about 10 years old when he ascended the throne; but of a pregnancy of judgment, and such improvement of learning, as was much above his years. His reign began with a prosperous war against the Scots, to whom the duke of Somerset, his uncle and protector, gave a great overthrow at Musselburg. In this short reign great progress was made in the reformation, by the zeal of archbishop Cranmer, and that of the protector; notwithstanding the strong opposition of Gardiner, bishop of Winchester, and Bonner, bishop of London. This reign is also memorable for the discovery made by Richard Chalcour, of the north east passage to Archangel in Muscovy, till then unknown by sea, and become since a great thorough fare from Asia into Europe; the goods from Spahan in Persia being now chiefly brought that way. Also for the fall of the lord high Admiral, Thomas Seymour, the protector's brother; and not long after of the

protector himself, by the arbitrary power of Dudley duke of Northumberland, a man of great ambition, who seeing the king in a consumption, and contriving to settle the crown in his own family, married his fourth son, the lord Guilford Dudley with the lady Jane Gray, of the royal blood by the mother's side; for she was daughter to Henry Gray, duke of Suffolk, by Frances his wife, daughter of Mary, queen of France, sister to Henry VIII. Then he got king Edward to declare her his successor by will, to the prejudice of his sisters; and this will was confirmed by the privy-council and the judges. The king reigned but six years, and was buried at Westminster.

*July 6, 1553, MARY I*, eldest daughter of Henry VIII, by his first wife, daughter of Ferdinand king of Spain, succeeded her half brother Edward. 'Tis true, the lady Jane Gray, mentioned in the former reign, was proclaimed queen before her, according to king Edward's will. But that will being thought illegal; as contradicting his father's will, Norfolk and Suffolk were the first counties that opposed the settlement of the lady Jane, and stood out for queen Mary; who having got the crown, made it her business to explode the reformation, and restore popery with a vengeance; which she did in 18 months, but with so much cruelty, that the kingdom blazed every where with human sacrifices. Archbishop Cranmer, and four other bishops, ended their lives in those popish flames. The two popish bishops, Gardiner, lord chancellor of England, and Bonner, bishop of London, men of a revengeful spirit, and cruelly imbittered against protestantism, were the great promoters of those extreme barbarities. The lady Jane Gray, the duke of Northumberland her father-in-law, the duke of Suffolk her own father, her husband, and his brother the lord Thomas Gray, lost their lives upon the scaffold. The lady Jane, then about seventeen years of age, was beheaded in the tower, two hours after her husband, and died a lasting monument in history, of piety, constancy, wisdom, wit and learning above her age, and beyond her sex. She fell a sacrifice to her friend's ambition, by whose prevalence she assumed the crown with tears. But the lady Elizabeth, called by the popish party *The hope of the hereticks*, remained still a stumbling block. She was committed under a slight pretence of treason; and suffered

suffered above a twelvemonth's confinement, before her innocence could procure her liberty. At last, queen Mary, being near 40 years of age, married king Philip of Spain; which marriage occasioned an insurrection. It was in this reign we lost Calais in France, after it had been in our possession above 200 years. The queen died upon it; and with her life expired a reign, begun, continued and ended in blood, happy in nothing but the shortness of it. She was buried at Westminster.

Nov. 17, 1558, ELIZABETH, daughter of Henry VIII. by Ann of Bullen, succeeded next to queen Mary, her half sister. She proved an excellent queen, the glory of her sex and admiration of the age she lived in. She restored the reformation, and brought it to that perfection, in which it has continued ever since in the church of England: For which she was excommunicated by the pope, and her subjects absolved from their allegiance; which occasioned plot upon plot, and rebellion upon rebellion. The Roman party was powerful in her time, and strove hard to cut her off by treachery, or dethrone her by force, but it pleased God to preserve her, during the whole course of her reign, from all her enemies, both at home and abroad. Memorable was the year 1588, for the Spanish invasion, attempted by king Philip with his *invincible armada*, but disappointed by God's providence. On the whole ocean she commanded, which spread her fame over the globe, and made her name every where respected. With much reluctance she consented to the death of Mary, queen of Scots, charged with high treason in England; where she was fled for shelter, from a potent faction in Scotland. The queen grieved much for the death of the earl of Essex, whose fall was occasioned more by her favor, than his crimes. She lived but two years after, aged 69, and having reigned 44 years, was buried at Westminster abbey. It was in her reign the inquisition of England was set up, I mean the Star Chamber, and high Commission court; which grew so very grievous and arbitrary, that they were both suppressed by an act of Charles I.

*The Two Crowns united.*

THE union of England and Scotland immediately after the decease of queen Elizabeth, happened in the person of

*Mar. 24, 1603.* JAMES STUART, the first king of Great Britain, and the sixth of that name in Scotland, who succeeded queen Elizabeth as next heir; being great grandson of Margaret, eldest daughter of Henry VII. He was son of Mary queen of Scots, beheaded in the late reign; and she was daughter to James V, of Scotland, son of James IV, by the aforesaid Margaret. His father was Henry lord Darnley, who was grandson likewise of the same queen Margaret, by the earl of Angus, her second husband. Before he left Scotland, he narrowly escaped a conspiracy, managed by the earl of Gowry, and his brothers; and soon after his arrival here, he was wonderfully delivered from the gunpowder treason, contrived by the papists, when the king, church and state were to be destroyed at once, by blowing up the parliament. Among some memorable things of this reign, I reckon the two royal visits his majesty received from Christiern IV, king of Denmark, whose sister Ann was king James's consort; which frankness, unusual with crowned heads, the king acknowledged with all sense of gratitude: The creation of a new order called Baronets, next to a Baron, and made hereditary: The fall of lord chancellor Bacon, a man of wonderful parts and universal knowledge: And that of Sir Walter Raleigh, a great man, who by the interest of the Spanish ambassador, then in great favor at court, lost his head upon a scaffold, after a sentence passed 15 years before. The king's issue was Henry, his eldest son, the people's darling, who died in his father's life time. Charles his successor, and Elizabeth, married to the unfortunate Frederick, elector palatine of the Rhine; Mary and Sophia, who died young. King James was too much a scholar, and too little a soldier; for he talked much of religion, but never cared to draw the sword in its defence. Though he was born and bred in presbytery, according to the reformation of the kirk of Scotland, yet he thought episcopal government in the church so great support to the crown, that he often used to say, *No bishop, no king.* The office of  
master

master of the ceremonies, for the reception and entertainment of princes and ambassadors was first established by this king. He reigned 23 years; died at Theobalds, a royal palace in Hertfordshire, aged 59 years, and was buried in Henry VII. chapel. Thus ended a peaceable, but inglorious; a plentiful, but luxurious reign; to make way for one both turbulent and tragical.

Mar. 27, 1625. CHARLES I, only surviving son of king James, succeeded next. He was born at Dumferling, in Scotland, 1600, and crowned at Westminster 1625: But his crown proved a crown of thorns, and his reign ended in blood. He had a bigotted wife, Henrietta, daughter to the French king Henry IV, who strove eagerly to bring in popery and arbitrary power; and he had a ministry ready moulded for it. His wonderful compliance with the queen made him do many things contrary to the laws of the kingdom; and he would sooner give ear to his ministers, than follow the advice of his parliament. His favorite, the duke of Buckingham, was stabbed by Felton, out of zeal for the public good. In short, the nation was twelve years without a parliament, and the king ventured against law, to raise ship-money by his own authority, which put the whole nation into a ferment. The cruel massacre in Ireland of between two and three hundred thousand English protestants, though wrong charged upon the king, was a great aggravation. The Scots entered into a covenant against Episcopacy, which he forced upon them. This drew on a remonstrance from the dissenters in England, and occasioned the long parliament, convened by the king for redress of grievances. They proceeded in that affair in a regular parliamentary way, till some bad men on both sides inflamed the people to that excess which brought on the cruel and destructive civil war. The king was obliged to part with his two grand ministers, archbishop Laud and the earl of Strafford, who lost their heads upon a scaffold. At last the sword was drawn and several battles fought: The king fell into the hands of his worst enemies; who, to take away his life by methods of pretended justice, erected a court, by which he was sentenced to death, as the author and contriver of the late intestine war; and accordingly was beheaded before Whitehall, Jan. 30, 1648, being done in the name of the whole people of England.

when the better part looked upon it with horror and indignation. The king was privately buried in Windsor chapel, leaving three sons and three daughters, Charles his successor, James duke of York, and Henry duke of Gloucester: Mary, who married William, prince of Orange, father to king William III. Elizabeth, who died a prisoner in the isle of Wight, soon after her father's death; and Henrietta, married to the duke of Orleans, only brother to Lewis XIV.

*Jan. 30, 1649,* CHARLES II, eldest son of Charles I, succeeded his father, but was kept from the crown above eleven years. During which time England was reduced to a common wealth, but moulded into various shapes, till at last Oliver Cromwell assuming the government, under the title of Lord protector, kept England in awe, subdued Scotland, reduced Ireland, beat the Hollanders, got Dunkirk and Jamaica from Spain, and became a terror to Europe in general. King Charles yielding to some conditions imposed upon him by the kirk of Scotland, was received by the Scots; and being crowned at Scoon, they sent an army with him into England, to recover that kingdom: But being totally defeated at Worcester, he wandered about in disguise for six weeks, till he made his escape into France; from whence he was forced to fly into the Spanish dominions, upon a league concluded by Cromwell with France against Spain. Several attempts were made by the loyal party, but none that could take effect: nor was there any hope of a restoration till Oliver's death, which happened on the third of September, 1658. He left two sons, Richard who succeeded him in the protectorship, and Henry in the government of Ireland. But Richard was soon turned out by the army, as being lukewarm in the cause; and the rump parliament restored, under the name of the Junta, consisting only of such members as were devoted to the cause, the rest having been secluded. This Junta was soon after dissolved, to make way for a new model of government, called the committee of safety, consisting of 23 members. The parliament being met in April 1660, voted the return of king Charles, as lawful heir to the crown. And he was accordingly proclaimed at London, May 8, where he made a most magnificent entry the 29th, being his birth-day; and the 23d of April following, on

St. George's

St. George's day, was crowned at Westminster, with the utmost state and solemnity: So universal was the joy of his subjects for the restoration of monarchy and the British constitution. Thus the laws of England were revived, the church re-established, and all things restored to their proper channel. The next year the king married Catherine of Portugal, whose barrenness was a misfortune to England. Prince Henry, duke of Gloucester, a hopeful prince, and the people's darling, died soon after the restoration: But the duke of York, his brother, had too great a share in the government, during the reign of king Charles. The standing army was disbanded, but general Monk had great honour and riches; was created duke of Albemarle, and buried like a prince after his death. Several of the late king's judges were tried as traitors, condemned and executed; but died without any retraction. As for the king, he proved of an excellent temper, affable and easy of access; of acute and judicious parts, of great insight into men and manners, and generally beloved by all parties for his innate clemency. The fittest person in the world for the English government, had not his love to ease and pleasure made him averse to business. Mars had governed long enough in the late reign, to make way for Venus; and Charles, who had been so great a sufferer in his exile, was willing to make himself amends with the pleasures of love and gallantry. Wherefore he indulged all parties, and secured himself at home, however things went abroad. Henry VIII had the way to keep his subjects in awe, but Charles II had that of getting their hearts. His voluptuousness proved fatal to the nation; for his subjects, following his example, sunk to such a degree of lewdness and effeminacy, that the business of this reign seemed only to breed gallants for the ladies. Among some memorable things we may reckon his parting with Dunkirk to the French, for a paltry sum; and his blowing up Tangier in the Streights, after great sums expended for the improving and keeping it: The vast subsidies he received from his long parliament, which were strangely misapplied: His shutting up the exchequer, after it was filled with loans, to the ruin of many persons and families: The two Dutch wars, which ended with no advantage to either side, but served so far the French interest, as to teach them the art of naval

naval war, and to give them the pleasure of seeing the two greatest protestant states weaken one another: The dreadful plague this nation was visited with, while we were engaged in the first Dutch war; the burning of London, which happened just after, and the popish plot, for which many suffered death, are remarkable events in this reign. He died Feb. 6, 1685, in the 55th year of his age, and was buried privately at Westminster. Though king Charles had an amorous disposition, and did not much concern himself with religion or politics, yet his meek temper to all men, took so much with his subjects, that he died universally lamented; and only those rejoiced at it, whose interests and hearts were wrapt up in the duke of York: He had no lawful issue, but many natural children. The two first were the duke of Monmouth his favorite; and the earl of Plymouth, who died at Tangier. Those two were before the restoration. After which he had three sons by the Dutchess of Cleveland, viz. the dukes of Cleveland, Grafton and Northumberland. By Nell Gwyn two sons, of which one died young, and the other was duke of St. Albans. And by the dutchess of Portsmouth he had the duke of Richmond: In all eight sons and five daughters.

*Feb. 6, 1685.* JAMES II, succeeded his brother Charles, but proved unfortunate to himself and people. As soon as he came to the crown, he convinced the world of his zeal for the Romish cause. However, by his first declaration, he promised great matters to his subjects, particularly to the church of England, which had struggled so hard in the late reign to secure his succession. He had the good luck to suppress the insurrection of Argyl in Scotland, and that of Monmouth in England (who were both beheaded) and having a brave army on foot, he presently broke loose on the laws, and made his will the measure of his government. To do it with the better gloss, he set up a dispensing power by virtue whereof he might superceed any law; and Romans were admitted into publick offices, without taking the oaths required. The rights of the universities he invaded, and made Magdalen college, at Oxford, a prey to his violence. Seven bishops were sent as criminals to the Tower, for refusing an illegal compliance to his will; but upon trial they were acquitted by law. The kingdom swarmed with papists from all parts: Popish schools, cha-  
pels

pels and monasteries were set up against law. Father Petre, a jesuit, and several popish lords, sat in the privy council, and some popish judges on the bench. In short, upon these bare-faced practices, it was high time for the protestant party, to check the growing power of popery, and to request the prince of Orange to vindicate his consort the princess's right, and that of these three nations. The prince being come over with a land army, revived the hopes of all good protestants, and sunk those of the papists. King James had a gallant army of 30,000 men, which by his orders marched to Salisbury plain, as soon as he heard of the prince's landing at Torbay. But finding the nation in general declare for the prince, and that his own forces daily deserted, he did not think it convenient to stand a battle. Mean while the prince moved on, and the king upon his approach returned to London. This made his army break up, and march off in great confusion, some one way, and some another. Dec. 10, 1688, he sent his queen into France, with the pretended prince of Wales; and on the 11th, late at night, he withdrew himself from Whitehall, steering his course the same way. At Faversham in Kent, he was stopt by some sturdy fellows, then Jesuit-hunting: But being known by several gentlemen, who got him out of their hands, he was prevailed upon to return to Whitehall, which he did on the 16th. The next day he went off again, directly to France, where his queen was already landed; and the prince came up to St James's palace, where he kept his court. Soon after which he had both the civil and military power lodged in him by the convention of lords and commons, which being met Jan. 22, at Westminster, voted the abdication of king James, and the throne to be vacant. He, in the mean time, took sanctuary in the French court, for above 12 years, and died at St. Germain's, his usual place of residence, Sept. 16, 1701, aged 68. Thus ended the life of king James in obscurity. His first wife, when he was duke of York, was Ann, eldest daughter to Hyde, earl of Clarendon, Lord high chancellor of England, by whom he had issue, the queens Mary and Ann. By his second wife, an Italian princess, he had several, but short lived children; except another Mary, who was born and died in France, aged 20 years.

*Feb.*

Feb. 13, 1689. WILLIAM III, and MARY II, prince and princess of Orange, succeeded upon the vote of the convention, That *king James had abdicated the government, and the throne was thereby vacant.* After which the convention voted an offer of the crown to the prince of Orange; and to demonstrate farther their gratitude and generosity, together with the great value they had for the princess of Orange, notwithstanding the male-administration of her unhappy father, they raised her to a joint sovereignty with the prince; the public acts to run in the name of both; but the executive power to be solely in the king: So that the prince and princess were equal in dignity, but not in authority. The princess, upon this, set out from Holland, and arrived at Whitehall, Feb. 12. 1689. The next day being the 13th, the crown was offered to their highnesses, in the name of both houses; which being accepted, they were solemnly proclaimed on that day, and upon the 11th of April following, crowned with great pomp and magnificence. The settlement of the crown was thus: *To be enjoyed by them during their lives, and the life of the survivor of them; and after their decease, to be to the heirs of the princess; and for default of such issue, to the princess Ann of Denmark, and the heirs of her body; and for default of such issue, to the heirs of the body of the said prince of Orange.* In Scotland the same course was taken for settling the government there. And to prevent all divisions from any pretended title to the crown, and to preserve a certainty in the succession thereof, this settlement was confirmed by an act of parliament, which passed Decemb. 16, 1689, with this excellent proviso, *That all and every person reconciled to, or holding communion with the church of Rome, or professing the Popish religion, or that shall marry a Papist, shall be excluded, and be for ever incapable to enjoy the crown of England and Ireland, or any part of the same; that in such a case the people shall be absolved of their allegiance; and the crown shall descend to the next person being Protestant, that should have inherited the same, in case the said person or persons so reconciled, &c. as aforesaid, were naturally dead.* Mean while the parliament voted a war against France, which was carried on with various success on both sides, the French king being at that time in his most flourishing condition. Ireland was then in arms for king James, power

powerfully assisted by France, both with men and money, to secure that kingdom for him, and thereby facilitate his restoration here, but all to no purpose. Two campaigns made an intire conquest of that island; the first famous for king William's signal victory at the Boyne; the other for the English victory at Aghrim, under the principal conduct of general Ginckle; the consequence of which was the taking of Limerick, and the total reduction of Ireland. Immediately after the battle at the Boyne, king James (who saw it only at a distance) not thinking himself safe in Ireland, returned into France. The taking of Cork and Kinsale, by Churchill, earl of Marlborough; the wonderful resistance of Londonderry, and the great vigour and courage of the Inniskilling men, in the North of Ireland, deserve to be recorded. Scotland had also a party in arms for king James, 1689, under the command of viscount Dundee, while the castle of Edinburgh held out for the said king, under the duke of Gordon. But Dundee being slain in fight, and his forces routed, the duke of Gordon soon after surrendered the castle to the government. In England, king William had a revengeful party to keep under; some plotting against his life, others betraying his councils; all endeavouring to work the nation into a general disgust, that he scarce knew whom to trust; insomuch that the crown proved to him no desirable possession. During a bloody war of 9 years continuance, several great battles were fought, particularly at Fleras, Stienkirk, and Landen, in which, though the French had the advantage by their numbers, it cost them excessive dear. The two sieges of Namur are very remarkable, the first successful to the French, the last to the allies, who carried it with the utmost bravery, from an army within under marshal Boufflers; and in the fight of a French army without of 100,000 men, commanded by marshal Villeroy. At sea we had two general fights, both in the channel. In the first the French had the better and kept the sea, but made no advantage of it: In the last, fought at the Hogue, we got an intire victory: The Rising Sun and two others were burnt at Cherburgh, and 13 more men of war burnt at the Hogue; besides about as many more that were sunk, lost and destroyed. Queen Mary's death in 1694, was a great grief both to king and people: A princess admired all over Europe, for her beauties of mind and person. The war with

with France went on, till at last all parties grew weary of it, and France herself sought for peace; not (I confess) in a precarious manner, but under the vain notion of giving peace to Europe. It was concluded at Reswick, near the Hague, in 1697; by which France gave up most part of her conquests. July 29, 1700. William duke of Gloucester, the only surviving issue of princess Ann of Denmark, departed this life at Windsor, in the 12th year of his age. His majesty at his return, consulted with his parliament what effectual means might be used for securing the succession in the protestant line, and extinguishing the hopes of all pretenders, and their open and secret abettors. Accordingly, the parliament passed a bill for the farther limitation of the crown, and with the royal assent it was enacted, *That after king William and the princess Ann of Denmark, both dying without issue, the crown should go next in the Protestant line to the princess Sophia, electress and dutchess dowager of Hanover, daughter of the princess Elizabeth, late queen of Bohemia, only daughter of king James I; and after her decease, to the heirs of her body, being protestants.* Thus did this heroic prince not only rescue these kingdoms from popish slavery, but provided as much as possible for their future security. September, 1701, king James died at St. Germain's. Upon his decease the French king provoked this nation in the highest manner, and drew upon him a universal resentment and indignation, by presuming to proclaim the (pretended) prince of Wales, king of England, Scotland and Ireland, after he had owned king William as such by the treaty of Reswick. So that all things tended to a new breach with France, towards which the parliament voted great subsidies, while the king was making strong alliances abroad. But when the time for action drew near, it pleased God to take this royal hero to himself, March 8, 1702; after a reign of 13 years and some weeks. He died at Kensington, and was buried at Westminster. He was the only issue of William of Nassau, prince of Orange, and Mary, eldest daughter of king Charles I. He was born at the Hague, Nov. 4, 1650, ten days after his father's death, and two months before his time, which gave him that weak habit of body. His queen was his cousin German, but by her he had no issue. Thus died king William, who, like a true Nassau, made it his business to secure liberty and property, and rescue

rescue Europe from the incroaching power of France. To save Holland, his native country, he struggled with fire and sword, and at last recovered her liberty. To save England, he exposed his life by sea and land. By this means Great-Britain and Holland became united in one interest, which France always endeavoured to divide, and this union may be looked on as a sufficient barrier against all pretenders to arbitrary monarchy. He revived the martial spirit of the British nation, shook the foundation of the French king's greatness, and left the demolition of it to his successors.

March 8, 1702. ANN, second daughter of James II. succeeded king William; whose death was a great joy to France, and as great a misfortune to England and her allies. But the queen stopt the first immediately, and soon dissipated the fears of the last. April 23d she was crowned with the usual solemnity, and on the 4th of May following, war was proclaimed at London, Vienna, and the Hague, against France and Spain. The success of that war is worthy our admiration, and almost incredible. The rapid conquest of the Spanish Guelderland, the electorate of Colone, and bishoprick of Liege: The prodigious victory over the French and Bavarians, totally routed at Blenheim on the Danube, after their lines were forced at Schellenberg, by the surprizing conduct and bravery of the duke of Marlborough; the retaking the strong fortrefs of Landen from the French, and conquering from the duke of Bavaria (an unfortunate friend to France) all his estates in Germany: The forcing the French and Bavarians out of their lines in Brabant, which was thought impracticable. The battle of Ramellies, so fatal to France, and glorious to England, attended by an extraordinary desertion of the French and Spanish troops, and the surrender of Brabant, and most part of Flanders, to their lawful sovereign. The victory of Oudenard; the taking of Lisle and Tournay, the defeating of the French army at Blarenies, and the conquest of Mons; are such events, as will render her majesty's reign famous to all posterity. If we turn to Spain, how bold and successful was our attempt at Vigo, where we took and destroyed the whole Plate fleet men of war and others, in all 38 sail, of which not one escaped? What can be greater than our taking Gibraltar in the morning with an inconsiderable force, and keeping the same

against the whole strength of France and Spain, who attempted by sea and land to recover it, but were at last shamefully forced to quit their enterprize? the same fate the French had before Barcelona, which being taken by the English and Dutch, conducted by the earl of Peterborough, was soon after besieged by king Philip at the head of a great army, and after a sharp siege, he and his troops forced to an inglorious retreat into France: Upon which all Catalonia, Arragan, Valencia, and other parts of Spain, submitted to Charles III, under the influence of her majesty's arms. In Italy, who could have expected such a dismal turn in the affairs of France, as happened in the year 1707, by the powerful influence of England? A numerous army of French and Spaniards intirely routed and destroyed before the walls of Turin, by those two great commanders, the duke of Savoy, and prince Eugene his cousin. The duke of Savoy, when stript of all his dominions by the power of France, forced to quit his capital city, and hunted from place to place by his enemies, yet beat the French much superior in number, forced their intrenchments, and drove them from the gates of Turin into Dauphiny, leaving behind them all their artillery, ammunition, cash, and baggage, with the loss of 20,000 men at least, from the beginning of the siege of Turin. Thus Piemont was abandoned, and the Milanese, Mantuan, Modenese, Parmasan, and Montferrat, yielded up. In this queen's reign also, England and Scotland were united into one kingdom, notwithstanding such difficulties as were thought insuperable, after several fruitiefs attempts of this kind, for a century past, and the strong opposition she expected from the Scots. Under those discouragements her majesty proceeded; and one year completed, what a whole age could not bring to pass. To conclude, the successes in her reign justly pronounced her one of the most triumphant monarchs of former ages, and her piety and personal virtues will ever be acknowledged by the British nation. In the latter end of the year 1709, died prince George of Denmark, consort to her majesty queen Anne: Soon after which a malignant party worked themselves into her favour, and quite overturned that ministry which was a glory to their own country and a terror to France. Our allies were basely deserted, the greatest advantages given

up,

up, and a peace made with our enemies, as if they had been conquerors. The army was disbanded, and all the men of war laid up to make the way smooth for the pretender. And such was the eagerness of this new Jacobite ministry, that their violent haste overfet their own scheme; for their proceedings did so perplex and disorder her majesty, already in a bad state of health, that it soon brought her to her death-bed, as she herself complained. And though the end of this excellent queen was troublesome to herself, yet it was critical with respect to the nation: Her majesty was born at St. James's, Feb. 6, 1664; and having had a princely education, she was, by her uncle king Charles II, for the security of the protestant religion in Great Britain, disposed of in marriage to his royal highness prince George of Denmark, 1683; by whom she had two sons and four daughters who all died in their infancy.

*Of the Settlement of the Crown in the House of Hanover.*

**S**OPHIA, the fourth and youngest daughter of Frederick V, Elector Palatine of the Rhine and king of Bohemia, and of Elizabeth of Great Britain, was, in the year 1658, married to Ernest duke of Brunswick and Lunenburg, afterwards elector of Hanover; which duke Ernest succeeded to the bishoprick of Osnaburg; and also to the dukedom of Hanover, upon the death of his elder brother John, who died without male issue, 1680.

The elector Ernest had issue by the said Sophia, George I, king of Great Britain; Frederick, slain in Transilvania, 1690, valiantly fighting against the Turks; Maximilian, the third son, deceased; Charles, the fourth son, slain at the battle of Cassaneck in Albania, 1690. Christian, fifth son, shot in the river Danube, crossing to charge the French, at the battle of Munderkingen, in 1703. Ernest duke of York and bishop of Osnaburgh: Sophia their only daughter was married to Frederick, the first king of Prussia, and had by him Frederick II, king of Prussia, who married with his cousin german, Sophia Dorothy, only daughter of king George I. and had Charles, king of Prussia, and a numerous issue.

## G E O R G E I.

Pursuant to the act of settlement on the death of queen Ann (the princess Sophia also dying two month's before) George, the next indisputable protestant heir, was, on the 11th of August, 1714, proclaimed king of Great Britain, &c. by the unanimous voice of the people.

The king having immediate notice of the queen's death and his own succession, hastened over to England, bringing with him his son, whom he soon after created prince of Wales. On the 18th of September, 1714, his majesty landed at Greenwich, where he was met by the lords of the regency, many of the privy council, and others of the nobility and gentry. From thence, on the 20th, he made his public entry into London, with a prodigious concourse and train of nobility and gentry. Being thus peaceably arrived and crowned, he dissolved the parliament, under which his right of succession had been endangered, and then in a particular manner gratified those who in the worst of times, and under the frowns of the late ministry, had shewn themselves his friends. King George had early intelligence, that Lewis XIV, would convey the pretender into Scotland; and accordingly in 1715 he landed there and was proclaimed: Many of the nobility and gentry joined him in hopes of a general disaffection in England; but the king's forces soon dissipated our fears; for in the two actions, at Preston in England, and Dumblain in Scotland, the enemy was quite routed: The pretender slipped away with some chiefs of his party, and left the others to shift for themselves. After which, about 16 Scotch lords were attainted. The earl of Derwentwater, an English peer, and the viscount Kenmure of Scotland were beheaded. Of lesser note many were imprisoned, and some executed. On April 22, 1715, happened that amazing and curious total eclipse of the sun. In 1716, the septennial act was made: and at the close of the year was a great frost of three months continuance; about which time began to appear those flashing fireams of light from the north, hitherto unaccountable. In 1717, the Swedish plot in favour of the pretender, was discovered and frustrated, by his majesty's great wisdom and fortitude. In 1718 we had a quarrel with Spain: The king's fleet commanded by  
admiral

admiral Byng, engaged theirs near Sicily, and gained a victory the most compleate perhaps that ever was: The ships on each side about 25, and their force in general being equal: Fifteen were taken, and seven or eight more were burnt or sunk. In 1719; a party of Spaniards, with some fugitive Scotch lords, encouraged by Charles of Sweden landed in Scotland: General Wightman killed some, and took the rest prisoners; but the lords made their escape. This year and the next, are very remarkable for the South Sea scheme, and many other specious airy bubbles to get money; in which a million and a half sterling *was won and lost by the adventurers.* A little before this, James Shepherd was executed for a design to kill the king; as was James Mathews, for printing and publishing a treasonable libel. In 1722, some hundred of British slaves were freed from captivity by his majesty's treaty with the Moors. And in June 16, the same year, died John Churchill, duke of Marlborough. The king made a visit this summer round the west of England to Portsmouth; and at his return was discovered a dangerous conspiracy against the government: It was the subject of a long parliamentary inquiry; and the result was, that several lords were committed to the Tower; councillor Lyster was hanged, and bishop Atterbury was deprived and banished. In 1724, his majesty instituted two king's professors of modern languages and history; one in Cambridge and one in Oxford. The next year he revived the order of Bath with greater dignity and splendour: and soon after, in conjunction with the states of Holland, he got the Ostend company demolished which was set up by the emperor, to hurt the English and Dutch. In 1726, he sent admiral Wager with a strong squadron of ships up to the harbour of Revel, which effectually hindered the Russians joining against us, or disturbing the peace of the north. Then followed the secret alliance between the emperor and king of Spain, levelled against our interest and priviledges; the first effect of which was, the Spaniards demand of Port-Mahon and Gibraltar, the latter of which they besieged with great vigour, but all in vain, it was so well supplied and defended. During these things, in the beginning of June, 1727, his majesty set out for Hanover, but being taken ill on the road, he continued so till he came to his

brother's house at Osnaburg, where he died on the 11th of June, in the 67th year of his age, and was buried at Hanover. He was a prince of great and singular virtues; wise, valiant, temperate and generous: Had an honest spirit, and a composed resolution, ever to vindicate the honour of his crown and the rights of his people. He left an only son, George, prince of Wales, who succeeded him, and a daughter named Sophia, married to Frederick II, king of Prussia. His wife was the lady Sophia, daughter of his uncle the duke of Zell, a fine princess, with many graceful endowments. She died towards the end of the year 1726, at the castle of Aton in Lunenburg, where she had been retired several years.

## G E O R G E II.

*June 14, 1727,* An express arriving with an account of the death of George I, his late majesty, George II, then in the 44th year of his age, repaired from Richmond where he had received the intelligence to Leicester house; and the members of the privy council were sworn anew. The king declared his firm resolution to preserve the constitution in church and state; and to cultivate those alliances which his father had made with foreign princes. At the same time he took and subscribed the oath for the security of the church of Scotland, as required by the act of union. Next day he was proclaimed king of Great Britain. The parliament assembled in pursuance of the act for that purpose; but was immediately prorogued by commission to the 27th day of the month. The king, in his speech to both houses at the opening of the sessions, professed a fixed resolution to merit the love and affection of his people, by maintaining them in full enjoyments of their religious and civil rights. All which he most inviolably observed. On the 11th day of October following, the coronation, with that of his queen, was performed at Westminster abbey, with the usual solemnity; and at the time when the courts of France and Spain were perfectly reconciled, and Europe freed from the calamities of war.

It will not be amiss here to observe that his late majesty's queen was the princess Wilhelmina Charlotte Caroline, daughter to John Frederick, marquis of Brandenburg Anspach;

Anspach; to who his majesty was espoused on the 2d of January, 1705; and by whom he had two sons, Frederick Lewis, prince of Wales, born at Hanover, Jan. 31, 1707; and William Augustus, born at London, April 15, 1721. She had likewise born four princesses, namely, Ann, Amelia, Caroline, and Mary, and was afterwards delivered of Louisa, married in the sequel to the king of Denmark.

In the year 1728, the merchants of London complained by petition of the Spaniard's depredations, and drew up an address that his majesty would be graciously pleased to use his endeavours for preventing such depredations; and to secure to his subjects the free exercise of commerce and navigation to and from the British colonies in America. The commons having made further progress in the enquiry, passed some resolutions, in which the Spaniards were accused of having violated the treaties subsisting between the two crowns; and with having treated inhumanely the masters and crews of ships belonging to Great Britain.

The year following his majesty signified his intention to visit his German dominions, and having prorogued both houses, appointed his queen regent of the realm; and set out for Hanover the 17th day of May, in order to remove the misunderstanding between that electorate and the court of Berlin. The whole united kingdom of Great Britain at this juncture enjoyed uninterrupted repose; and his majesty soon after returned. The parliament assembled on the 13th of January, the king gave them to understand that the peace of Europe was firmly established, and that all former conventions made with Spain in favour of the British trade and navigation, were renewed and confirmed; and that the court of Spain had agreed to an ample restitution and reparation for unlawful seizers and depredations; and no one concession made to the prejudice of his subjects.

In 1732, the excise scheme was proposed by Sir Robert Walpole, who, in parliament, expatiated largely on the frauds that were committed by smugglers, who enriched themselves by cheating the public. He proposed to join the law of excise to those of the customs, in regard to tobacco. That a further subsidy of three farthings per lb. charged upon imported tobacco, should be still levied at  
the

the custom house, and payable to his majesty's civil list, as heretofore; with appointment of proper officers to inspect the same. Those who argued against the scheme, accused the minister of having misrepresented the frauds, and made false calculations; and would only serve to expose the factors to such oppression, that they would not be able to continue the trade; and consequently this scheme would tend to promote a general excise, which was in all countries considered as a grievous oppression; and would produce an additional swarm of excise men and warehouse-keepers, multiply the dependants on the crown, and enable it still farther to influence the freedom of elections. The whole nation being alarmed, clamoured loudly against the bill, and Sir Robert went in fear of his life; and at last thought proper to drop the design, by moving that the second reading of the bill might be postponed till the 12th day of June.

In November, 1733, the prince of Orange arrived at Greenwich, in order to espouse the princess royal; but the marriage was postponed some little time, on account of his being taken ill, and forced to retire to Bath for the recovery of his health.

In the year 1734, the powers at war upon the continent acted with surprising vigour. The Russians and Saxons invested the city of Dantzick, in hopes of securing king Stanislaus, but he escaped in the disguise of a peasant to Marienwarder, in the Prussian territories. And upon the Rhine the French armies bore down all resistance. So little respect did the French court pay to the British nation, that an edict was published in Paris to compel the British subjects to enlist in the French army. About this time Sir John Norris sailed to Lisbon, to protect the Portuguese against the resentment of the king of Spain.

On the 27th of April, 1736, the marriage was celebrated between the prince of Wales and the princess of Sax-Gotha. The king put an end to the session of Parliament, appointed his queen regent, and set out for Hanover. The same year Capt. Porteous was tried for murder, in Scotland, and convicted, but the queen, as regent, granted a reprieve; this so incensed the mob, that they rose in the night, broke open the prison doors, and left him hanging

in the city on a dyer's pole, and quietly dispersed to their several habitations, without one person ever being found out.

1737. In this year a breach happened between his majesty and his eldest son Frederic, then prince of Wales in regard to the concealment of the pregnancy of the princess of Wales, of the princess Augusta, which his majesty resented as an indignity offered to himself and his queen. In this year, on the 20th of Nov. 1737, queen Carolina, his majesty's consort, died of a mortification in her bowels, in the 55th year of her age.

1738. At this period the princess of Wales was delivered of a son, who was baptized by the name of George, since king of England. His birth was celebrated with uncommon rejoicings.

1739. Letters of marque and reprisals were granted against the Spaniards, a promotion made of general officers; the troops were augmented; a great fleet was assembled at Spithead; a reinforcement sent out to admiral Haddock; and an embargo laid on all merchant ships. Admiral Vernon was sent to the West Indies to take command of the squadron in those seas, and to annoy the trade and settlement of the Spaniards, on which war was declared against Spain, the 23d day of October, 1739.

On the thirteenth day of March, 1740, an express arrived from the West Indies, of admiral Vernon having taken Porto Bello, with six ships only, and demolished all the fortifications of that place. In the same year happened the great frost which began on Christmas day, and continued to the latter end of February. The river of Thames was froze over, and booths and tents were erected on it.

1741. In the course of this year, while admiral Haddock lay at anchor in the bay of Gibraltar, with 12 ships of the line, the Spanish fleet joined with the French squadron from Toulon passed by. The British admiral drew up in line of battle, but the Spaniards sending a flag of truce, and the combined fleets amounting to double the number of the English squadron, admiral Haddock was obliged to desist and suffer them to prosecute their voyage without molestation. The same year Sir John Norris twice sailed with a powerful squadron to the court of Spain, without taking

taking any step to annoy the enemy. The land forces of Great Britain at that time, exclusive of the Danish and Hessian auxiliaries, amounted to 60,000 men, and the fleet consisted of above 100 ships of war, manned by 54,000 sailors.

In 1743, the British resident in Paris was given to understand that a declaration of war must ensue, which was there published on the 20th day of March, and on the 31 day of March war against France was published at London, amidst the acclamations of the people. About June 1743, was fought the battle of Dettingen, general Clayton and Monro were killed, the duke of Cumberland, who behaved with the greatest bravery and uncommon proofs of courage, was shot through the leg, the earl of Albemarle, general Huske, and several officers of distinction were wounded. Our sovereign exposed his noble person to a severe fire of cannon, as well as musquetry, and rode between the first and second line with his sword drawn, encouraging the troops to fight for England's honour. In October following the king returned to Hanover, and put an end to that campaign.

1744, On the 11th of February, a naval engagement between the French and English was fought by admiral Matthews and Lestock, off Toulon, when unfortunately capt. Cornwall was killed in the engagement, but the loss of our men in general was very inconsiderable; the French fleet got off under cover, and Matthews steering to Minorca, accused Lestock of misbehaviour on the day of action, suspended him, and sent him prisoner to England, who in his turn accused Matthews. This became the subject of a parliamentary enquiry, when a court martial was constituted, several commanders were cashiered, Lestock honourably acquitted, and Matthews rendered incapable of serving for the future.

In the month of June, 1744, commodore Anson returned from his voyage round the world, in the Centurion man of war, in which he had suffered innumerable hardships in the course of three years and nine months. But fortunately having taken a rich ship that sails annually between Aquapulco in Mexico, and one of the Philippine isles, with a treasure on board to the value of three hundred and thirteen thousand pounds sterling, he returned to Canton,

and

and proceeded from thence to the cape of Good Hope, and prosecuted his voyage to England, where he arrived in safety. About this time, Sir John Balchan, in his majesty's ship the victory, unfortunately was lost at sea with a crew on board amounting to eleven hundred choice officers, seamen, and volunteers. And in the year 1745, Cape Briton was taken, a place of great consequence to the French, and fortified at a prodigious expence. About the same time France, in order to divert the intention on the English, formed a design of sending prince Charles, the pretender's eldest son, to Scotland, and having supplied him with money and arms, embarked in a frigate the 14th day of July, and was joined off Belleisle by the Elizabeth, a 60 gun French man of war, as his convoy. But falling in with the Lion an English ship of the line, met with so warm a reception that the Elizabeth with much difficulty reached the harbour of Brest. The frigate continued her course to Scotland and landed on the coast of Lochabar. His majesty then being abroad, a messenger was dispatched to hasten his return, who arrived the latter end of August.

England in general were unanimous in opposing prince Charles, when they heard of his landing in Scotland. Sir John Cope advanced against the rebels there with what forces he could muster up. But the rebels avoiding him, marched on to Perth, where they were joined by lord George Murray, the duke of Perth, and several persons of distinction. Being considerably augmented they entered Edinburgh without opposition, took possession of Holyrood house, and caused his father to be proclaimed at the market cross, defeated Sir John Cope, at Preston Pans, reduced the city of Carlisle, and penetrated as far as Derby. He there called a council, and finding the king's troops on their passage to attack him, resolved to make his retreat to Scotland with all possible expedition. They abandoned Derby on the 6th of December, and the 12th entered Preston, continuing their march northwards. The militia of Cumberland were ordered by his royal highness the duke, to harass them in their march, and notwithstanding all endeavours, they retreated with the greatest conduct and regularity. By the time that prince Charles had invested the castle of Stirling, commanded by general Blakeney, a considerable body of the kings forces were assembled

at

at Edinburgh, under the command of general Hawley, who resolved to relieve Stirling castle, and advanced to Linlithgow. On the 13th day of January, 1746, his whole army rendezvoused at Falkirk. On the 17th, the rebels were perceived in full march to attack the king's forces; and for that purpose had taken possession of a hill on their right. Hawley ordered two regiments of dragoons to drive them from that eminence. Their prince gave the signal to fire, by waving his cap, and soon threw the royal army into the utmost confusion; few or none would have escaped, had not general Huske and brigadier Cholmondely rallied some regiments, and made a gallant stand, which favoured the retreat of the rest to Falkirk.

Things being in this situation, it was at last judged necessary to send his royal highness the duke of Cumberland to take the command of the army upon him. He put himself at the head of the troops at Edinburgh, consisting of 14 battallions of infantry, 2 regiments of dragoons, and 1500 highlanders. On the last day of January, 1746, the duke marched to Linlithgow; and the enemy who had renewed the siege of Stirling castle, not only abandoned that enterprize, but crossed the river Forth with great precipitation, and marching to Culloden there engaged. The cannonading began about one o'clock, and in less than 30 minutes they were totally defeated, and the field covered with dead bodies. Prince Charles fled, and was forced to get away by stealth, after lurking about the islands five months. Several persons of distinction were taken prisoners, among whom was the earl of Cromartie, lord Kilmarnock, lord Lovat and lord Balmerino. They were sent up to London and tried by the house of the peers, found guilty, and all but lord Cromartie were executed upon Tower hill. Several inferior officers were tried in London, found guilty and executed upon Kennington common. Those who were seduced by their superiors received his majesty's gracious pardon; and none fell a sacrifice to resentment, but those who were the promoters and instigators of so unnatural and cruel a rebellion.

1747. The prince of Orange was elected stadtholder and captain-general and admiral of the united provinces in Holland. The same year a French squadron in the latitude of Belle-isle, was defeated and taken by admirals Anson and

and Warren; and capt. Grenville, on board the *Defiance* man of war, unhappily lost his life.

All the belligerent powers were by this time heartily tired of a war that had consumed such immense treasures, and done so much mischief. The king of France, in a personal conversation with Sir John Ligonier, expressed his desire of a pacification; which in the year 1748, was settled and concluded at Aix la Chapelle.

Had England trusted less to so base an enemy, and their ministers been but true to their country, it would have prevented a scene of bloodshed that afterwards necessarily ensued to prevent her from becoming a sacrifice to her enemies, and slaves and dupes to popery and superstition.

In the month of November, 1748, his majesty opened the sessions of parliament with a speech; the purport of which was, that the definitive peace was signed by all parties concerned in it, and that he had made the most effectual provision for securing the rights and interest of his subjects; and farther observed, that we might promise ourselves a long enjoyment of the blessings of peace. In this same year was the rejoicing for the peace, by grand fireworks in St. James's Park.

In the year 1749, Cape Breton was given up to the French; and notwithstanding all former treaties, several disputes arose about settling the limits in North America. In the year 1750 was erected the British herring fishery. On the 8th day of February, between the hours of 12 and 1, an earthquake alarmed the inhabitants of London and Westminster, which rocked the floors, and shook down the furniture, china, &c. from off the shelves. On the same day of the next month, the inhabitants were alarmed a second time with a shock of an earthquake more severe than the former; and notwithstanding it seemed to threaten a dissolution, the providence of God was so great that not a house was shook down, or any damage sustained.

On the 20 day of March, 1751, his royal highness the prince of Wales departed this life, in the 45th year of his age, owing to a pleuretic disorder; and to the unspeakable lamentation of all people who were well wishers to their country.

In the same year the bill for naturalizing of foreigners was read in the house; but several petitions by the merchants

chants and others being thrown in, the ministry did not think proper to persist in an unpopular measure, at so critical a juncture; and was therefore no more brought upon the carpet. In the same year Mr. Murray was sent prisoner to Newgate, for speaking disrespectfully of the house of commons; which occasioned a great demur among the people.

Besides the loss of the prince, his majesty was deeply affected in the course of a few months after, by the untimely death of his youngest daughter, the queen of Denmark, who died at Copenhagen on the 19th day of December. Her death had been preceded about two months, by that of her brother in law the prince of Orange, no less regretted by the united provinces of Holland, for his candour, integrity and love to his country.

1752. Among the proceedings of this sessions, an act was passed for the prevention of murder, that every criminal so convicted, should be executed in 48 hours, and his body delivered to surgeon's hall for public example and utility of surgery. This sessions was brought upon the carpet, an act containing a regulation for the better preservation of the game. In this year the stile was changed according to the Gregorian computation by the alteration of eleven days.

1753. This sessions was chiefly distinguished by an act for naturalizing the Jews, and a bill to prevent clandestine marriages. The last passed without much opposition. The first passed in the house of lords, and was entitled, "An act to permit persons professing the Jewish religion, to be naturalized." Several debates were held thereon, and the merchants of London petitioned strongly against it, but were overpowered by the ministry. Notwithstanding all their arguments the bill passed both houses; but, finding the inconveniency, was repealed the latter end of the sessions.

1754. This year the ambition and intrigues of the French court, by which the British interest was invaded and disturbed on the continent of America, extended itself likewise to the East Indies, where they endeavoured to embroil the English company with divers nabobs and princes. But being defeated by the vigilance of Mr. Clive, the British forces proved too many for them.

*The Young Man's best Companion.* 3<sup>d</sup> 3

1755. Whilst all Europe was in suspense about the fate of the English and French squadrons, preparations for a vigorous sea war was carrying on in England, with unparalleled spirit and success; and admiral Boscawen had orders to attack the French ships where ever he should meet them. The Alcide and Lys, French men of war, was about this time taken by the Dunkirk, capt. How, and the Defiance, capt. Andrews.

The beginning of 1756, measures were taken by the government of England to arm themselves against a French invasion. A considerable number of troops were levied: New ships of war built, and daily put in commission. Above eighty ships of the line and threescore frigates were now equipped, and a considerable body of land-forces assembled, when on the 3d of February, a proclamation was issued, requiring all officers civil or military, to act in defence of their country, in case of an invasion.

Admiral Byng sailed for the Mediterranean with ten ships under his command, in order to reinforce fort St. Philip. He arrived at Gibraltar, and was there reinforced by a detachment from the garrison, and joined by the Phoenix, capt. Harvey, in order to assist Minorca. On the 8th of May he sailed from thence, and fell in with the French fleet under command of Galissoniere, and proceeded to action. But not bearing down with the expedition necessary upon the occasion (whether through want of courage, or with the intent to avoid the error of admiral Matthews in a prior engagement, I cannot undertake to say) threw the rest of the fleet into confusion; and rear-admiral West could not pursue his advantage without running the risk of having his communication with the line cut off. Clear it is that Mr. Byng made little or no use of his artillery; and Galissoniere seemed equally as averse to action, and tho' more in number than the English, took the advantage of Byng's hesitation and sheered off.

The consequence of this was, directions were dispatched to admiral Hawke to send Byng home under an arrest, which were accordingly obeyed.

Galissoniere pursued his course to Minorca, where a stout defence was made by the brave general Blakeney, who supported the siege with the utmost bravery, but being overpowered in time by numbers, was forced to capitulate.

The articles of capitulation were no sooner signed, than Galissoniere made all the haste back to France, lest he should be intercepted by admiral Hawke, who he was informed was coming to the assistance of fort St. Philip. The admiral arrived; and to his great mortification found the French colours there flying.

Sir Edward Hawke being disappointed in hopes of encountering Galissoniere, and relieving the English garrison of St. Philip's, asserted the empire of Great-Britain in the Mediterranean, by annoying the commerce of the enemy, and blocking up their squadron in the harbour of Toulon.

As the ministry were determined to make their chief efforts against the enemy in North America, where the first hostilities had been committed, two regiments were sent there under the command of general Abercrombie, and the chief command of all the forces in America, was committed to the earl of Loudon, a nobleman of an amiable character, who had several times distinguished himself in the service of his country. Mr. Abercrombie set sail for America in march, but the earl of Loudon did not embark till the latter end of May.

These measures being taken, his majesty on the 18th day of May 1756, published a declaration of war against the French king; importing, that since the treaty of Aix la-Chapelle, the usurpations and encroachments made upon the British territories in America, had been too notorious not to resent: That the unjustifiable practices of the French governors, and officers acting under them, were still continued, till they broke out in open acts of hostility in 1754, when in profound peace and without any declaration of war, a body of French troops, bearing the French king's commission, attacked in an hostile manner, and took possession of an English fort on the river Ohio, in North America: That great naval armaments were prepared in the ports of France; and a large body of French troops embarked from that kingdom: That though the French ambassador was sent back to England, to accommodate these differences, it was only under the specious pretence of amusement: That in consequence of the necessary measures taken by the king of Great Britain, for preventing the success of such a dangerous design, the French ambassador was recalled from England: The fortifications of  
Dunkirk

Dunkirk were enlarged, great bodies of troops marched down to the sea coast of France, and the British dominions threatened with invasion: That tho' the king of England, in order to frustrate these intentions, had given orders at sea for seizing the ships belonging to the French king and his subjects, yet he had hitherto contented himself with detaining those ships that had been taken, and preserving their cargoes entire, without proceeding to confiscation; but it being at last evident from the hostile invasion of Minorca, that the court of Versailles were determined to reject all proposals of accommodation, his Britannic majesty could no longer, consistently with the honour of his crown, and the welfare of his subjects, put up with these insults, were the motives that induced him to declare war.

The beginning of June the French king declared war against England.

About this time admiral Watson and Mr. Clive destroyed the famous Angria, a piratical prince in the neighbourhood of Bombay, seized upon his treasures, and returned back in triumph to Madras.

This year, in November, general Blakeney arrived with the forces of Minorca at Portsmouth, amidst the acclamations of the people, whose veneration increased for Blakeney, in proportion to their abhorrence for Byng. His majesty raised him to the rank of an Irish baron, in reward for his past services.

1757 Was remarkable for the trial of Admiral Byng, on board the St. George at Portsmouth, by a court martial; when, upon examination of several witnesses, it appeared that Mr. Byng had not done his endeavours to seize and destroy the French ships, or assist such of his majesty's ships in taking the same when in their power; and as he laid liable to the 12th article of war, he was adjudged guilty, and accordingly sentenced to be shot on board one of his majesty's ships, which sentence was put in execution on the 14th of march, on board the Monarque, at Portsmouth, notwithstanding his recommendation to mercy. The same year an attempt was made by one Damien to assassinate the king of France. The king of Prussia obtained a complete victory over the Austrians near Prague, with the loss of Marechal Schwerin, who was killed in the battle. About the same time the French took possession of Hanover; and

the duke of Cumberland was severely pressed on all sides by the French, and obliged to sign the convention of Closter Seven, by which 38000 Hanoverians were compelled to lay down their arms, and the French let loose against the king of Prussia. In this same year happened the battle of Rosbach, wherein the king of Prussia with 20,000 men, defeated 25,000 French and Imperialists, besides gaining a great victory over them at Lissa.

1758. The beginning of this year died the princess Caroline, aged 45, a lady of an amiable character, and regretted as a pattern of piety and unbounded benevolence. A great number of French privateers and merchantmen were taken by British cruizers in the channel. This year was remarkably famous for taking Louisbourg in America, and Senegal and Goree in Africa. This year admiral Pocock engaged a French squadron in the East Indies. The duke of Marlborough died at Munster in Germany, universally lamented. The king of Portugal was assassinated by the duke d'Aveiro, but fortunately escaped, being but slightly wounded.

Among the domestic occurrence of this year, Dr. Florence Hensley was impeached of high-treason, tried at the court of King's Bench, Westminster, and found guilty: It appeared he was employed as a spy by the court of France, and gave intelligence of our proceedings the foregoing year, against Rochfort. After he had received sentence, he was for some private reasons, best known to the ministry, pardoned, on condition of perpetual exile. The same year Dr. John Shebbear, a very popular writer, was taken into custody for writing the 6th letter to the people of England, and being found guilty, was sentenced to pay a fine of 5 l. to stand once in the pillory and confined 3 years in the king's bench.

1759, Several captures were made of French ships. The honour of the British flag was more effectually asserted by admiral Boscawen, who defeated the French squadron in the Mediterranean, under the command of Monsieur de la Clue. This year was more remarkably distinguished by taking Guadaloupe, Ticonderoga, Niagara, Crown Point and Quebec, where the unfortunate general Wolfe lost his life in the defence of his country.

In the beginning of the year 1760, the famous French commander, Thurot, attempted to land in Ireland, where, after a smart engagement between him and capt. Ellior, Thurot was killed with about 300 of his men, and his whole squadron taken. The loss of the English amounted only to 5 men killed and 31 wounded. Soon after this event the attention of the public was wholly engaged by the trial of lord G. Sackville for disobeying the orders of prince Ferdinand at the battle of Minden. The court martial found him guilty, which sentence was confirmed by the king, and, to shew his dislike of his behaviour, struck him off from the list of privy counsellors. In this same year lord Ferrers was executed at Tyburn for murder.

Oct. 25, 1760, departed this life, his majesty king George II, who was seized with an apoplectic fit, at six a clock in the morning, and laying a small time speechless, expired. No king ever gained more universally the hearts of his subjects, who lamented his loss with the deepest sorrow.

### GEORGE III.

As soon as the demise of the crown was signified to the secretaries of state, Mr. Pitt repaired to Kew, to communicate the event to his new sovereign George III, who ascended the throne in the 23d year of his age. The lords of the privy council were immediately assembled, and the next day his majesty was proclaimed with the usual solemnity. On the 18th of Nov. the parliament met, and his majesty made a most gracious speech from the throne.

1761. Though the animosity of the belligerent powers was not abated, yet their efforts slackened and degenerated by degrees into slight skirmishes and small engagements. The courts of Petersburg, Vienna, France, Sweden and Poland made several declarations of peace, signed at Paris the 31st of March, and counter declarations of Great Britain and Prussia appeared on the 3d of April. In the month of July the members of the privy council being assembled, the king gave them to understand that he had made choice of the princess Charlotta of Mecklenburg for his consort, a princess distinguished by every eminent virtue and amiable endowment, whose illustrious line had ever distinguished

guished themselves by a particular attachment to his family. In consequence of which the earl of Harcourt was appointed ambassador to demand the princess in marriage. The dutchesses of Ancaſter and Hamilton were appointed ladies of the bedchamber, to attend her, and on the 8th of Auguſt the princeſs left Mecklenburg, and on the 22d arrived at Stade, and the next day embarked from thence to England. After a tedious voyage, during which the fleet was expoſed to contrary winds, the princeſs landed on the 7th of September, in the afternoon, at Harwich, and proceeding to London, was graciously received by his Maſteſty at St. James's, and the ſame evening the nuptial ceremonies were performed. The ceremony of the coronation ſtill remained to compleat the brilliancy of this joyful ſeaſon, but was performed on the 22d of September, 1761, amidſt the acclamations of the people.

But to return to the negotiation, to which there were fix principal objections, which the patriot miniſter Mr. Pitt, warmed with honeſt indignation, rejected with the utmoſt contempt, as not chuſing to ſubmit to a conquered enemy who would gladly have made peace on their own terms. In 1762, the earl of Briſtol was recalled from Spain on account of that court's reſuſing to give a categorical anſwer to England's propoſal for peace, that country ſeemingly being inclined to join with France againſt England. War was declared in form againſt Spain; and England proved very ſucceſsful therein. This was not to be wondered at, as the late miniſter Mr. Pitt had the preceeding year employed a very conſiderable part of the force of the nation againſt the French colonies in the Weſt Indies. The conqueſt of Martinique naturally drew on the ſurrender of all the dependant iſlands; the Engliſh being now ſole poſſeſſors of all the Charibbies and that chain of iſlands extending from the eaſtern point of Hiſpaniola almoſt to the continent of South America. The Britiſh adminiſtration were now determined to transfer the war into the Spaniſh Weſt Indies, they turned their thoughts at once on the capital objects the Havannah, the centre of trade and navigation of that part of the world. Lord Albemarle was appointed commander of the land forces, and admiral Pocock of the fleet. They ſailed from Portſmouth the 5th of March, the day on which the Grenades were ſurrendered

surrendered and a fleet sailed from Martinique under the command of Sir James Douglas to reinforce them, which happily met at cape Nicholas on the 27th of May. From thence they proceeded through the old straits of Bahama to the Havannah, the object of many hopes and fears. When all things were in readiness for landing, the admiral with a great part of the fleet, bore westward, to divert the attention of the enemy, while commodore Keppel and capt. Harvey approached the shore to the eastward of the harbour, and on the 7th of June effected a landing there in the utmost order. The principal part of the army was destined to act on the east side, in order to cover the siege, and secure the English parties employed in procuring provisions. The other part were occupied in the attack of fort Moro which commanded the town and entrance into the harbour. The enemy's fire and the besiegers were for some time near equal. The Spaniards made a sally, but were obliged to retire with a loss of between 2 and 300 men left dead on the spot. Several attacks being made without much success, proved that nothing but the course of time could effect this dangerous undertaking. Unfortunately for us 5000 of our soldiers and 3000 seamen were down at one time with various disorders; but on the 12th of July their hopes were revived by being joined by the Jamaica fleet, and received a few days afterwards a reinforcement from New York. On the 30th of July the miners did their business so effectually, as to make a breach which the general and engineer judged practicable for the troops to pass thro'. Thus animated by the hope of ending their toils, the English troops mounted the breach with such alacrity and intrepidity, as astonished the enemy who flew on all sides, 400 of the enemy were killed on the spot, and 400 more threw down their arms and begged quarters. The Spanish marquis de Gonsales bravely fell as he was rallying his people. And governor Don Lewis de Velasco who had bravely defended the fort, resolved to share the same fate. He collected 100 men in an entrenchment he had made round his colours, but being deserted by his men, he disdain- ing to fly or call for quarters, received a mortal wound and fell, offering his sword to the conquerors. A capitulation now ensued, the garrison was reduced to about 700 men, who marched out with honours of war, and were to be conveyed

conveyed to Spain, and the English troops took possession of the Havannah the 14th of August, when they had been before it 2 months and 8 days. From the conquest of this place resulted all the advantages obtainable in war, as by it the enemy lost a whole fleet, and in specie and merchandize a computed sum of three millions sterling. This success was crowned with another equally as fortunate, that is to say, the capture of a large Spanish register ship, called the *Hermione*, whose cargo consisted of an immense sum of money.

Aug. 12, 1762, at half an hour after 7 in the morning, the queen was safely delivered of a prince, and a few days after the royal infant was created prince of Wales and earl of Chester. Nov. 12, his majesty opened the sessions of Parliament, and declared to them in his speech, that the enemy had been brought to accept of a peace on such terms as he trusted would give his parliament satisfaction, which was signed at Paris the 10th of Feb. 1763, and proclaimed at London on the 22d of the same month.

Soon after a rule for an information was granted in the King's Bench, to take up the supposed author, printers and publishers of the *North Briton* numb. 45, and Mr. Wilkes, the supposed author, was taken into custody and carried to the tower; but pleading his privilege as a member of parliament, was admitted to bail. Upon a trial ensuing he was adjudged the author, and the *North Briton* was condemned to be burnt at the royal exchange, &c. as a false, scandalous and seditious libel: A tumultuous riot happened at the burning the above paper, and the thieves were insulted in their office by the populace. On the 6th of December was tried the cause by Mr. Wilkes, on account of the messengers seizing his papers, &c. which was adjudged illegal by lord chief justice Pratt, and a verdict given in favour of Mr. Wilkes, and on the 24th of December he suddenly set out for France.

On the 31st of March, 1763, the cyder bill passed both houses, notwithstanding several petitions from different counties. The 19th of April the king prorogued the parliament. The 12th of May Sir Charles Asgill, six aldermen, the recorder, &c. waited on his majesty with the city of London's address on the peace, who were hissed by the populace. Bow bell tolled and rang a dumb peal, as

did likewise St. Brides. The 16th of August the queen was delivered of another prince who was baptized by the name of Frederic. On the 10th of December came on the trial of Mr. Leach, who was arrested by the messengers as the supposed printer of the North Briton, numb. 45, when after a hearing of 7 hours, a verdict was given for Mr. Leach, with damages and full cost of suit, and several other causes were tried in favour of sundry of Mr. Leache's men, who likewise recovered their damage and cost of suit.

1764, Jan. 16, was consummated the marriage between the prince of Brunswick and the princess Augusta, his majesty's Sister. The 20th of the same month Mr. Wilkes was expelled the house, and a new member for Aylesbury chose in his room. About this time several disputes arose between lord Clive and the East India company, and several fresh disturbances in the East Indies became the subject of conversation.

1765. Thursday, Jan. 10, His majesty went to the house of peers, and opened the sessions. Some thousands of weavers went in a body to petition his majesty to relieve them, who graciously promised that their grievances should be redressed. In the middle of the same month sentence was passed on Mr. Williams for republishing numb. 45, of the North Briton, which was to pay a fine of 100 l. to stand once in the pillory, to be imprisoned 6 months in the king's bench, and enter into security of 1000 l. for his good behaviour for 7 years, all which was put in execution the 14th of February following. April 16, came on before the house of lords the trial of lord Biron for killing in a duel Mr. Chaworth, and was only found guilty of manslaughter. May 10, the isle of man was vested in the crown of Great Britain, and an act passed for regulating post letters. August 21st, about 4 in the morning, her majesty was happily delivered of another prince, who was baptized by the name of William Henry. September 2, the demolition on the Jutties of the harbour of Dunkirk was begun. October 5, the ships arrived at Philadelphia, with the stamps on board, which occasioned great disturbances all over America. The 31st departed this life, in the 45th year of his age, his royal highness the duke of Cumberland, England's glory and the people's darling. He was buried at Westminster, the 9th of November. Sunday, the 29th

29th of Dec. also departed this life, his royal highness prince Frederic William, his majesty's youngest brother, in the 16th year of his age.

1766. Jan. 14, the parliament met according to adjournment, when his majesty went to the house of peers, and made a most gracious speech. The next day the house of peers waited on his majesty with their compliments of condolance on the death of his royal highness prince Frederic William, his majesty's brother. The latter end of this month a squadron of men of war were fitting out with all expedition at Portsmouth and Plymouth. Several petitions from Bristol, York, Liverpool and other trading places were presented complaining of the hardships the different inhabitants laboured under from the decay of trade to North America, and a repeal of the stamp act was heartily wished for by the people in general. Accounts were daily received of the insurrections of divers of the American colonists. About the beginning of February her royal highness the princess of Brunswick was brought to bed of a prince.

As nothing but dissatisfaction and discontent are to be heard of at this time among the people in general, it is humbly presumed (and there are great hopes for that presumption) that the present sessions of parliament will amicably adjust the situation of affairs, so as to render the subjects of England once more a free and flourishing people.
